TECHNICAL SPECIFICATIONS	286

INTRODUCTION

The xStack DGS-3400 series is a member of the D-Link xStack switch family. xStack is a complete family of stackable devices that ranges from edge 10/100Mbps switches to core Gigabit switches. xStack provides unsurpassed performance, fault tolerance, scalable flexibility, robust security, standard-based interoperability and an impressive support for 10-Gigabit technology to future-proof departmental and enterprise network deployments with an easy migration path.

The Switch can be managed through the Switch's serial port, Telnet, or the Web-based management agent. The Command Line Interface (CLI) can be used to configure and manage the Switch via the serial port or Telnet interfaces.

This manual provides a reference for all of the commands contained in the CLI. Configuration and management of the Switch via the Web-based management agent is discussed in the Manual. For detailed information on installing hardware please refer also to the Manual.

Accessing the Switch via the Serial Port

The Switch's serial port's default settings are as follows:

- **115200 baud**
- **no parity**
- **8 data bits**
- **1 stop bit**

A computer running a terminal emulation program capable of emulating a VT-100 terminal and a serial port configured as above is then connected to the Switch's serial port via an RS-232 DB-9 cable.

With the serial port properly connected to a management computer, the following screen should be visible. If this screen does not appear, try pressing Ctrl+r o refresh the console screen.

Figure 1-1. Initial CLI screen

There is no initial username or password. Just press the **Enter** key twice to display the CLI input cursor – **DGS-3400:4#**. This is the command line where all commands are input.

Setting the Switch's IP Address

Each Switch must be assigned its own IP Address, which is used for communication with an SNMP network manager or other TCP/IP application (for example BOOTP, TFTP). The Switch's default IP address is 10.90.90.90. You can change the default Switch IP address to meet the specification of your networking address scheme.

The Switch is also assigned a unique MAC address by the factory. This MAC address cannot be changed, and can be found on the initial boot console screen – shown below.

Figure 1-2. Boot Screen

The Switch's MAC address can also be found in the Web management program on the Switch Information (Basic Settings) window on the Configuration menu.

The IP address for the Switch must be set before it can be managed with the Web-based manager. The Switch IP address can be automatically set using BOOTP or DHCP protocols, in which case the actual address assigned to the Switch must be known.

The IP address may be set using the Command Line Interface (CLI) over the console serial port as follows:

1. Starting at the command line prompt, enter the commands **config ipif System ipaddress xxx.xxx.xxx.xxx/yyy.yyy.yyy.yyy**. Where the **x**'s represent the IP address to be assigned to the IP interface named **System** and the **y**'s represent the corresponding subnet mask.
2. Alternatively, you can enter **config ipif System ipaddress xxx.xxx.xxx.xxx/z**. Where the **x**'s represent the IP address to be assigned to the IP interface named **System** and the **z** represents the corresponding number of subnets in CIDR notation.

The IP interface named **System** on the Switch can be assigned an IP address and subnet mask which can then be used to connect a management station to the Switch's Telnet or Web-based management agent.

Figure 1-3. Assigning an IP Address

In the above example, the Switch was assigned an IP address of 10.53.13.26 with a subnet mask of 255.0.0.0. The system message **Success** indicates that the command was executed successfully. The Switch can now be configured and managed via Telnet, SNMP MIB browser and the CLI or via the Web-based management agent using the above IP address to connect to the Switch.

NOTE: The DGS-3400 series of switches have the capability to be configured for an IP address of 0.0.0.0, or, in essence, have no IP address. This function maybe used to disable Layer 3 functions of the Switch. When the IP address is set to 0.0.0.0 (invalid IP address), the Switch can only be managed through the console port or SIM. Other management applications such as Telnet, Web-based and SNMP cannot be used to manage the Switch when its IP address is 0.0.0.0.

USING THE CONSOLE CLI

The Switch supports a console management interface that allows the user to connect to the Switch's management agent via a serial port and a terminal or a computer running a terminal emulation program. The console can also be used over the network using the TCP/IP Telnet protocol. The console program can be used to configure the Switch to use an SNMP-based network management software over the network.

This chapter describes how to use the console interface to access the Switch, change its settings, and monitor its operation.

Note: Switch configuration settings are saved to non-volatile RAM using the `save` command. The current configuration will then be retained in the Switch's NV-RAM, and reloaded when the Switch is rebooted. If the Switch is rebooted without using the `save` command, the last configuration saved to NV-RAM will be loaded.

Connecting to the Switch

The console interface is used by connecting the Switch to a VT100-compatible terminal or a computer running an ordinary terminal emulator program (e.g., the **HyperTerminal** program included with the Windows operating system) using an RS-232C serial cable. Your terminal parameters will need to be set to:

- **VT-100 compatible**
- **115200 baud**
- **8 data bits**
- **No parity**
- **One stop bit**
- **No flow control**

Users may also access the same functions over a Telnet interface. Once you have set an IP address for your Switch, you can use a Telnet program (in VT-100 compatible terminal mode) to access and control the Switch. All of the screens are identical, whether accessed from the console port or from a Telnet interface.

After the Switch reboots and you have logged in, the console looks like this:

```
DGS-3426P Gigabit Ethernet Switch
Command Line Interface

Firmware: Build 2.00-B46
Copyright(C) 2004-2007 D-Link Corporation. All rights reserved.
UserName:
PassWord:
DGS-3426P:4#
```

Figure 2- 1. Initial Console Screen after logging in

Commands are entered at the command prompt, **DGS-3400:4#**.

There are a number of helpful features included in the CLI. Entering the `?` command will display a list of all of the top-level commands.

```
?
clear
clear arptable
clear counters
clear fdb
clear log
clear port_security_entry port
config 802.1p default_priority
config 802.1p user_priority
config 802.1x auth_mode
config 802.1x auth_parameter ports
config 802.1x auth_protocol
config 802.1x capability ports
config 802.1x init
config 802.1x reauth
config access_profile profile_id
config account
config address_binding ip_mac ipaddress
config address_binding ip_mac ports
config admin local_enable
config arp aging time
CTRL+C  ESC  Quit  SPACE  Next Page  ENTER  Next Entry  All
```

Figure 2- 2. The ? Command

When entering a command without its required parameters, the CLI will prompt you with a **Next possible completions:** message.

```
DGS-3426:4#config account
Command: config account
Next possible completions:
<username>
DGS-3426:4#
```

Figure 2- 3. Example Command Parameter Help

In this case, the command **config account** was entered with the parameter **<username>**. The CLI will then prompt to enter the **<username>** with the message, **Next possible completions:**. Every command in the CLI has this feature, and complex commands have several layers of parameter prompting.

In addition, after typing any given command plus one space, users can see all of the next possible sub-commands, in sequential order, by repeatedly pressing the **Tab** key.

To re-enter the previous command at the command prompt, press the up arrow cursor key. The previous command will appear at the command prompt.

```
DGS-3426:4#config account
Command: config account
Next possible completions:
<username>

DGS-3426:4#config account
Command: config account
Next possible completions:
<username>

DGS-3426:4#
```

Figure 2- 4. Using the Up Arrow to Re-enter a Command

In the above example, the command **config account** was entered without the required parameter **<username>**, the CLI returned the **Next possible completions: <username>** prompt. The up arrow cursor control key was pressed to re-enter the previous command (**config account**) at the command prompt. Now the appropriate username can be entered and the **config account** command re-executed.

All commands in the CLI function in this way. In addition, the syntax of the help prompts are the same as presented in this manual – angle brackets **< >** indicate a numerical value or character string, braces **{ }** indicate optional parameters or a choice of parameters, and brackets **[]** indicate required parameters.

If a command is entered that is unrecognized by the CLI, the top-level commands will be displayed under the **Available commands:** prompt.

```
DGS-3426P:4#the
Available commands:
..                ?                clear                config
create            delete            disable              download
enable            login              logout              ping
ping6             reboot              reconfig            reset
save              show                upload

DGS-3426P:4#
```

Figure 2- 5. Available Commands

The top-level commands consist of commands such as **show** or **config**. Most of these commands require one or more parameters to narrow the top-level command. This is equivalent to **show what?** or **config what?** Where the **what?** is the next parameter.

For example, entering the **show** command with no additional parameters, the CLI will then display all of the possible next parameters.

```

Command: show
Next possible completions:
802.1p      802.1x      access_profile  account
acct_client address_binding arpentry        attack_log
auth_client auth_diagnostics auth_session_statistics
auth_statistics authen         authen_enable   authen_login
authen_policy autoconfig    bandwidth_control command_history
config      cpu          device_status   dhcp_relay
double_vlan error        fdb             firmware
greeting_message gvrp       hol_prevention  igmp_snooping
ipfdb       ipif        iproute         ipv6
jumbo_frame lacp_port   limited         link_aggregation
log          log_save_timing mac_notification mirror
mld_snooping module_info multicast        multicast_fdb
packet       poe         port_security   ports
radius       router_ports safeguard_engine scheduling
scheduling_mechanism serial_port    session
sim          snmp         sntp            ssh
ssl          stack_information stacking        stp
switch       syslog        system_severity time
time_range   traffic      traffic_segmentation
trusted_host utilization  vlan
DGS-3426P:4#

```

Figure 2- 6. Next possible completions: Show Command

In the above example, all of the possible next parameters for the **show** command are displayed. At the next command prompt, the up arrow was used to re-enter the **show** command, followed by the **account** parameter. The CLI then displays the user accounts configured on the Switch.

COMMAND SYNTAX

The following symbols are used to describe how command entries are made and values and arguments are specified in this manual. The online help contained in the CLI and available through the console interface uses the same syntax.

Note: All commands are case-sensitive. Be sure to disable Caps Lock or any other unwanted function that changes text case.

<angle brackets>	
Purpose	Encloses a variable or value that must be specified.
Syntax	create account [admin user] <username 15>
Description	In the above syntax example, users must supply a username in the <username> space. Do not type the angle brackets.
Example Command	create account admin newadmin1

[square brackets]	
Purpose	Encloses a required value or set of required arguments. One value or argument can be specified.
Syntax	create account [admin user] <username 15>
Description	In the above syntax example, you must specify either an admin or a user level account to be created. Do not type the square brackets.
Example Command	create account user newuser1

vertical bar	
Purpose	Separates two or more mutually exclusive items in a list, one of which must be entered.
Syntax	create account [admin user] <username 15>
Description	In the above syntax example, users must specify either admin , or user . Do not type the vertical bar.
Example Command	create account user newuser1

{braces}	
Purpose	Encloses an optional value or set of optional arguments.
Syntax	reset {[config system]}
Description	In the above syntax example, users have the option to specify config or system . It is not necessary to specify either optional value, however the effect of the system reset is dependent on which, if any, value is specified. Therefore, with this example there are three possible outcomes of performing a system reset. See the following chapter, Basic Commands for more details about the reset command.
Example command	reset config

Line Editing Key Usage

Delete	Deletes the character under the cursor and then shifts the remaining characters in the line to the left.
Backspace	Deletes the character to the left of the cursor and then shifts the remaining characters in the line to the left.
Insert or Ctrl+R	Toggle on and off. When toggled on, inserts text and shifts previous text to the right.
Left Arrow	Moves the cursor to the left.
Right Arrow	Moves the cursor to the right.
Up Arrow	Repeats the previously entered command. Each time the up arrow is pressed, the command previous to that displayed appears. This way it is possible to review the command history for the current session. Use the down arrow to progress sequentially forward through the command history list.
Down Arrow	The down arrow will display the next command in the command history entered in the current session. This displays each command sequentially as it was entered. Use the up arrow to review previous commands.
Tab	Shifts the cursor to the next field to the left.

Multiple Page Display Control Keys

Space	Displays the next page.
CTRL+c	Stops the display of remaining pages when multiple pages are to be displayed.
ESC	Stops the display of remaining pages when multiple pages are to be displayed.
n	Displays the next page.
p	Displays the previous page.
q	Stops the display of remaining pages when multiple pages are to be displayed.
r	Refreshes the pages currently displayed.
a	Displays the remaining pages without pausing between pages.
Enter	Displays the next line or table entry.

BASIC SWITCH COMMANDS

The basic switch commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create account	[admin user] <username 15>
config account	<username>
show account	
delete account	<username>
show module_info	
show device_status	
show session	
show switch	
show serial_port	
config serial_port	{baud_rate [9600 19200 38400 115200] auto_logout [never 2_minutes 5_minutes 10_minutes 15_minutes]}
enable clipaging	
disable clipaging	
enable telnet	<tcp_port_number 1-65535>
disable telnet	
enable web	<tcp_port_number 1-65535>
disable web	
save	{[config <config_id 1-2> log all]}
reboot	
reset	{[config system]}
login	
logout	
create trusted_host	<ipaddr>
delete trusted_host	<ipaddr>
show trusted_host	<ipaddr>

Each command is listed, in detail, in the following sections.

create account

Purpose	Used to create user accounts.
Syntax	create [admin user] <username 15>
Description	The create account command is used to create user accounts that consist of a username of 1 to 15 characters and a password of 0 to 15 characters. Up to 8 user accounts can be created.
Parameters	<i>admin <username 15></i> - Using this command will allow the admin user, created with this command, full rights and access to this switch. Commands in this manual with the Only Administrator-level users can issue this command restriction are for admin users only. <i>user <username 15></i> - Using this command will allow the user, created with this command, partial rights and access to this switch.
Restrictions	Only Administrator-level users can issue this command. Usernames can be between 1 and 15 characters. Passwords can be between 0 and 15 characters.

Example usage:

To create an administrator-level user account with the username “dlink”.

```
DGS-3400:4#create account admin dlink
Command: create account admin dlink

Enter a case-sensitive new password:****
Enter the new password again for confirmation:****

Success.

DGS-3400:4#
```

config account

Purpose	Used to configure user accounts
Syntax	config account <username>
Description	The config account command configures a user account that has been created using the create account command.
Parameters	<i><username></i> - Enter the new username of the account for which to modify the password.
Restrictions	Only Administrator-level users can issue this command. Usernames can be between 1 and 15 characters. Passwords can be between 0 and 15 characters.

Example usage:

To configure the user password of “dlink” account:

```
DGS-3400:4#config account dlink
Command: config account dlink

Enter a old password:****
Enter a case-sensitive new password:****
Enter the new password again for confirmation:****

Success.

DGS-3400:4#
```

show account

Purpose	Used to display user accounts.
Syntax	show account
Description	Displays all user accounts created on the Switch. Up to 8 user accounts can exist at one time.
Parameters	None.
Restrictions	Only Administrator-level users can issue this command.

Example usage:

To display the accounts that have been created:

```
DGS-3400:4#show account
Command: show account

Current Accounts:
Username      Access Level
-----
User101       user
Administrator Admin

DGS-3400:4#
```

delete account

Purpose	Used to delete an existing user account.
Syntax	delete account <username>
Description	The delete account command deletes a user account that has been created using the create account command.
Parameters	<username>- Enter the user name of the account to be deleted.
Restrictions	Only Administrator-level users can issue this command.

Example usage:

To delete the user account "System":

```
DGS-3400:4#delete account System
Command: delete account System

Success.

DGS-3400:4#
```

show module_info

Purpose	Used to display information about installed modules.
Syntax	show module_info
Description	Displays information about optional modules that may be installed on the Switch.
Parameters	None.
Restrictions	Only Administrator-level users can issue this command.

Example usage:

To display information about installed modules:

DGS-3400:4# show module_info					
Command: show module_info					
BOX ID	ID	Module Name	Rev.	Serial No.	Description
1	1	DEM-410X	A0	PA5A5A5A5	1 Port XFP Module
1	2	DEM-410X	A0	PA5A5A5A5	1 Port XFP Module
DGS-3400:4#					

show device_status

Purpose	Used to display current status of fans and power or power supplies.
Syntax	show device_status
Description	Displays information on the status of system fans and power supplies.
Parameters	None.
Restrictions	None

Example usage:

To display status of fans and power supply:

DGS-3400:4#show device_status				
Command: show device_status				
ID	Internal Power	External power	Side Fan	Back Fan
1	Active	Ready	OK	Fail
DGS-3400:4#				

show session

Purpose	Used to display a list of currently logged-in users.
Syntax	show session
Description	This command displays a list of all the users that are logged-in at the time the command is issued.
Parameters	None
Restrictions	Only Administrator-level users can issue this command.

Example usage:

To display the way that the users logged in:

DGS-3427:4#show session

Command: show session

ID	Live Time	From	Level	Name
---	-----	-----	----	-----
8	0:8:48.860	Serial Port	4	Anonymous

Total Entries: 1

CTRL+C ESC q Quit SPACE n Next Page p Previous Page r Refresh

show switch

Purpose	Used to display general information about the Switch.
Syntax	show switch
Description	This command displays information about the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To display the Switch's information:

DGS-3400:4#show switch

Command: show switch

```

Device Type       : DGS-3426P Gigabit Ethernet Switch
Unit ID          : 1
MAC Address       : 00-80-C8-34-27-00
IP Address        : 10.34.27.100 (Manual)
VLAN Name         : default
Subnet Mask       : 255.0.0.0
Default Gateway   : 0.0.0.0
Boot PROM Version : Build 1.00-B13
Firmware Version  : Build 2.00-B48
Hardware Version   : 2A1G
System Name       : DGS-3426P
System Location    : BR5-49
System Contact     : Junior Sample
Spanning Tree     : Disabled
GVRP              : Disabled
IGMP Snooping     : Disabled
MLD Snooping      : Disabled
TELNET            : Enabled (TCP 23)

Syslog Global State : Disabled
Single IP Management : Disabled
Dual Image        : Supported
    
```

DGS-3400:4#

show serial_port

Purpose	Used to display the current serial port settings.
Syntax	show serial_port
Description	This command displays the current serial port settings.
Parameters	None.
Restrictions	None

Example usage:

To display the serial port setting:

```
DGS-3427:4#show serial_port
Command: show serial_port
```

```
Baud Rate   : 115200
Data Bits   : 8
Parity Bits  : None
Stop Bits    : 1
Auto-Logout : 10 mins
```

```
DGS-3427:4#
```

config serial_port

Purpose	Used to configure the serial port.
Syntax	config serial_port {baud_rate [9600 19200 38400 115200] auto_logout [never 2_minutes 5_minutes 10_minutes 15_minutes]}
Description	This command is used to configure the serial port's baud rate and auto logout settings.
Parameters	<i>baud_rate [9600 19200 38400 115200]</i>– The serial bit rate that will be used to communicate with the management host. There are four options: 9600, 19200, 38400, 115200. <i>never</i> – No time limit on the length of time the console can be open with no user input. <i>2_minutes</i> – The console will log out the current user if there is no user input for 2 minutes. <i>5_minutes</i> – The console will log out the current user if there is no user input for 5 minutes. <i>10_minutes</i> – The console will log out the current user if there is no user input for 10 minutes. <i>15_minutes</i> – The console will log out the current user if there is no user input for 15 minutes.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure baud rate:

```
DGS-3400:4#config serial_port baud_rate 115200
```

```
Command: config serial_port baud_rate 115200
```

```
Success.
```

```
DGS-3400:4#
```

enable clipaging

Purpose	Used to pause the scrolling of the console screen when a command displays more than one page.
Syntax	enable clipaging
Description	This command is used when issuing a command which causes the console screen to rapidly scroll through several pages. This command will cause the console to pause at the end of each page. The default setting is enabled.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable pausing of the screen display when the show command output reaches the end of the page:

```
DGS-3400:4#enable clipaging
Command: enable clipaging

Success.

DGS-3400:4#
```

disable clipaging

Purpose	Used to disable the pausing of the console screen scrolling at the end of each page when a command displays more than one screen of information.
Syntax	disable clipaging
Description	This command is used to disable the pausing of the console screen at the end of each page when a command would display more than one screen of information.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable pausing of the screen display when a command output reaches the end of the page:

```
DGS-3400:4#disable clipaging
Command: disable clipaging

Success.

DGS-3400:4#
```

enable telnet

Purpose	Used to enable communication with and management of the Switch using the Telnet protocol.
Syntax	enable telnet <tcp_port_number 1-65535>
Description	This command is used to enable the Telnet protocol on the Switch. The user can specify the TCP or UDP port number the Switch will use to listen for Telnet requests.
Parameters	<tcp_port_number 1-65535> – The TCP port number. TCP ports are numbered between 1 and 65535. The “well-known” TCP port for

enable telnet

	the Telnet protocol is 23.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable Telnet and configure port number:

```
DGS-3400:4#enable telnet 23
Command: enable telnet 23

Success.

DGS-3400:4#
```

disable telnet

Purpose	Used to disable the Telnet protocol on the Switch.
Syntax	disable telnet
Description	This command is used to disable the Telnet protocol on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the Telnet protocol on the Switch:

```
DGS-3400:4#disable telnet
Command: disable telnet

Success.

DGS-3400:4#
```

enable web

Purpose	Used to enable the HTTP-based management software on the Switch.
Syntax	enable web <tcp_port_number 1-65535>
Description	This command is used to enable the Web-based management software on the Switch.
Parameters	<i><tcp_port_number 1-65535></i> – The TCP port number. TCP ports are numbered between 1 and 65535. The “well-known” port for the Web-based management software is 80.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable HTTP and configure port number:

DGS-3400:4#enable web 80

Command: enable web 80

Note: SSL will be disabled if web is enabled.

Success.

DGS-3400:4#

disable web

Purpose	Used to disable the HTTP-based management software on the Switch.
Syntax	disable web
Description	This command disables the Web-based management software on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable HTTP:

DGS-3400:4#disable web

Command: disable web

Success.

DGS-3400:4#

save

Purpose	Used to save changes in the Switch's configuration to non-volatile RAM.
Syntax	save {[config <config_id 1-2> log all]}
Description	This command is used to enter the current switch configuration into non-volatile RAM. The saved switch configuration will be loaded into the Switch's memory each time the Switch is restarted.
Parameters	<i>config</i> <config_id 1-2> – Specify to save current settings to configuration file 1 or 2. <i>log</i> – Specify to save current Switch log to NV-RAM. <i>all</i> – Specify to save all configuration settings. If nothing is specified after "save", the Switch will save all.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To save the Switch's current configuration to non-volatile RAM:

DGS-3400:4#save

Command: save

Saving all configurations to NV-RAM... Done.

DGS-3400:4#

reboot

Purpose	Used to restart the Switch.
Syntax	reboot
Description	This command is used to restart the Switch.
Parameters	None.
Restrictions	Only Administrator-level users can issue this command.

Example usage:

To restart the Switch:

```
DGS-3400:4#reboot
Command: reboot
Are you sure want to proceed with the system reboot? (y|n)
Please wait, the switch is rebooting...
```

reset

Purpose	Used to reset the Switch to the factory default settings.
Syntax	reset {[config system]}
Description	This command is used to restore the Switch's configuration to the default settings assigned from the factory.
Parameters	<i>config</i> – If the keyword 'config' is specified, all of the factory default settings are restored on the Switch including the IP address, user accounts, the switch history log and banner. The Switch will not save or reboot. <i>system</i> – If the keyword 'system' is specified all of the factory default settings are restored on the Switch. The Switch will save and reboot after the settings are changed to default. Rebooting will clear all entries in the Forwarding Data Base. If no parameter is specified, the Switch's current IP address, user accounts, the switch history log and banner are not changed. All other parameters are restored to the factory default settings. The Switch will not save or reboot.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To restore all of the Switch's parameters to their default values:

```
DGS-3400:4#reset config
Command: reset config

Are you sure to proceed with system reset except Stacking
Information, IP address, log, user account and banner?(y/n)y

Success.
DGS-3400:4#
```

login

Purpose	Used to log in a user to the Switch's console.
Syntax	login
Description	This command is used to initiate the login procedure. The user will be prompted for a Username and Password.
Parameters	None.
Restrictions	None.

Example usage:

To initiate the login procedure:

```
DGS-3400:4#login
Command: login

UserName:
```

create trusted_host

Purpose	Used to create the trusted host.
Syntax	create trusted_host <ipaddr>
Description	The create trusted_host command creates the trusted host. The Switch allows specification of up to four IP addresses that are allowed to manage the Switch via in-band SNMP or TELNET based management software. These IP addresses must be members of the Management VLAN. If no IP addresses are specified, then there is nothing to prevent any IP address from accessing the Switch, provided the user knows the Username and Password.
Parameters	<ipaddr> – The IP address of the trusted host to be created.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create the trusted host:

```
DGS-3400:4#create trusted_host 10.48.74.121
Command: create trusted_host 10.48.74.121

Success.

DGS-3400:4#
```

show trusted_host

Purpose	Used to display a list of trusted hosts entered on the Switch using the create trusted_host command above.
Syntax	show trusted_host <ipaddr>
Description	This command is used to display a list of trusted hosts entered on the Switch using the create trusted_host command above.
Parameters	<ipaddr> – The IP address of the trusted host to be viewed.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the list of trust hosts:

```
DGS-3400:4#show trusted_host
```

```
Command: show trusted_host
```

```
Management Stations
```

```
IP Address
```

```
-----  
10.53.13.94
```

```
Total Entries: 1
```

```
DGS-3400:4#
```

delete trusted_host

Purpose	Used to delete a trusted host entry made using the create trusted_host command above.
Syntax	delete trusted_host <ipaddr>
Description	This command is used to delete a trusted host entry made using the create trusted_host command above.
Parameters	<ipaddr> – The IP address of the trusted host.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a trusted host with an IP address 10.48.74.121:

```
DGS-3400:4#delete trusted_host 10.48.74.121
```

```
Command: delete trusted_host 10.48.74.121
```

```
Success.
```

```
DGS-3400:4#
```

logout

Purpose	Used to log out a user from the Switch's console.
Syntax	logout
Description	This command terminates the current user's session on the Switch's console.
Parameters	None.
Restrictions	None.

Example usage:

To terminate the current user's console session:

```
DGS-3400:4#logout
```

SWITCH PORT COMMANDS

The switch port commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config ports	[<portlist> all] {medium_type [fiber copper]} {speed [auto 10_half 10_full 100_half 100_full 1000_full {[master slave]}] flow_control [enable disable] learning [enable disable] state [enable disable] [description <desc 1-32> clear_description]}
show ports	{<portlist>} {[description err_disabled]}

Each command is listed, in detail, in the following sections.

config ports

Purpose	Used to configure the Switch's Ethernet port settings.
Syntax	[<portlist> all] {medium_type [fiber copper]} {speed [auto 10_half 10_full 100_half 100_full 1000_full {[master slave]}] flow_control [enable disable] learning [enable disable] state [enable disable] [description <desc 1-32> clear_description]}
Description	This command allows for the configuration of the Switch's Ethernet ports. Only the ports listed in the <portlist> will be affected.
Parameters	all – Configure all ports on the Switch. <portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) medium_type [fiber copper] – This applies only to the Combo ports. If configuring the Combo ports this defines the type of transport medium used. speed – Allows the user to adjust the speed for a port or range of ports. The user has a choice of the following: auto – Enables auto-negotiation for the specified range of ports. [10 100 1000] – Configures the speed in Mbps for the specified range of ports. Gigabit ports are statically set to 1000 and cannot be set to slower speeds. [half full] – Configures the specified range of ports as either full-duplex or half-duplex. [master slave] – The master setting (1000M/Full_M) will allow the port to advertise capabilities related to duplex, speed and physical layer type. The master setting will also determine the master and slave relationship between the two connected physical layers. This relationship is necessary for establishing the timing control between the two physical layers. The timing control is set on a master physical layer by a local source. The slave setting (1000M/Full_S) uses loop timing, where the timing comes from a data stream received from the master. If one connection is set for 1000M/Full_M, the other side of the connection must be set for 1000M/Full_S. Any other configuration will result in a link down status for both ports. flow_control [enable disable] – Enable or disable flow control for the specified ports. learning [enable disable] – Enables or disables the MAC address learning on the specified range of ports. state [enable disable] – Enables or disables the specified range of ports. description <desc 32> – Enter an alphanumeric string of no more than 32 characters to describe a selected port interface. clear_description – Enter this command to clear the port description of the selected port(s).
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the speed of port 3 of switch 1 to be 10 Mbps, full duplex, with learning and state enabled:

```
DGS-3400:4#config ports 1:1-1:3 speed 10_full learning enable state enable
Command: config ports 1:1-1:3 speed 10_full learning enable state enable

Success.

DGS-3400:4#
```

show ports

Purpose	Used to display the current configuration of a range of ports.
Syntax	show ports {<portlist>} {description err_disabled}
Description	This command is used to display the current configuration of a range of ports.
Parameters	<portlist> – Specifies a port or range of ports to be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) description – Adding this parameter to the show ports command indicates that a previously entered port description will be included in the display. err_disabled – Use this to list disabled ports including connection status and reason for being disabled.
Restrictions	None.

Example usage:

To display the configuration of all ports on the switch:

DGS-3400:4#show ports

Command: show ports

Port	Port State	Settings Speed/Duplex/FlowCtrl	Connection Speed/Duplex/FlowCtrl	Address Learning
1:1	Enabled	Auto/Enabled	Link Down	Enabled
1:2	Enabled	Auto/Enabled	Link Down	Enabled
1:3	Enabled	Auto/Enabled	Link Down	Enabled

PORT SECURITY COMMANDS

The Switch's port security commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config port_security ports	[<portlist> all] {admin_state [enable disable] max_learning_addr <max_lock_no 0-16> lock_address_mode [Permanent DeleteOnTimeout DeleteOnReset]}
delete port_security_entry	vlan name <vlan_name 32> port <port> mac_address <macaddr>
clear port_security_entry	port <portlist>
show port_security	{ports <portlist>}

Each command is listed, in detail, in the following sections.

config port_security ports	
Purpose	Used to configure port security settings.
Syntax	config port_security ports [<portlist> all] {admin_state [enable disable] max_learning_addr <max_lock_no 0-16> lock_address_mode [Permanent DeleteOnTimeout DeleteOnReset]}
Description	This command allows for the configuration of the port security feature. Only the ports listed in the <portlist> are affected.
Parameters	<i>portlist</i> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Configure port security for all ports on the Switch. <i>admin_state [enable disable]</i> – Enable or disable port security for the listed ports. <i>max_learning_addr <max_lock_no 0-16></i> - Use this to limit the number of MAC addresses dynamically learned in the FDB for the ports. <i>lock_address_mode [Permanent DeleteOnTimeout DeleteOnReset]</i> – Indicates the method of locking addresses. The user has three choices: ▪ <i>Permanent</i> – The locked addresses will not age out after the aging timer expires or the switch restarts. ▪ <i>DeleteOnTimeout</i> – The locked addresses will age out after the aging timer expires. ▪ <i>DeleteOnReset</i> – The locked addresses will not age out until the Switch has been reset or restarted.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the port security:

```
DGS-3400:4#config port_security ports 1:1-1:5 admin_state enable
max_learning_addr 5 lock_address_mode DeleteOnReset
Command: config port_security ports 1:1-1:5 admin_state enable
max_learning_addr 5 lock_address_mode DeleteOnReset

Success.

DGS-3400:4#
```

delete port_security_entry

Purpose	Used to delete a port security entry by MAC address, port number and VLAN ID.
Syntax	delete port_security_entry_vlan_name <vlan_name 32> port <port> mac_address <macaddr>
Description	This command is used to delete a single, previously learned port security entry by port, VLAN name, and MAC address. This command will only take effect if the lock address mode set using the config port_security ports command is set as permanent or delete on reset.
Parameters	<i>vlan name <vlan_name 32></i> - Enter the corresponding VLAN name of the port to delete. <i>port <port></i> - Enter the port number which has learned the previously entered MAC address. The port is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. <i>mac_address <macaddr></i> - Enter the corresponding MAC address, previously learned by the port, to delete.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a port security entry:

```
DGS-3400:4#delete port_security_entry vlan_name default port 1:6
mac_address 00-01-30-10-2C-C7
Command: delete port_security_entry vlan_name default port 1:6
mac_address 00-01-30-10-2C-C7

Success.

DGS-3400:4#
```

clear port_security_entry

Purpose	Used to clear MAC address entries learned from a specified port for the port security function.
Syntax	clear port_security_entry port <portlist>
Description	This command is used to clear MAC address entries which were learned by the Switch by a specified port. This command only relates to the port security function. This command will only take effect if the lock address mode set using the config port_security ports command is set as permanent or delete on reset.
Parameters	<i><portlist></i> – Specifies a port or port range to clear. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4

clear port_security_entry

specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

Restrictions Only administrator-level users can issue this command.

Example usage:

To clear a port security entry by port:

DGS-3400:4# clear port_security_entry port 1:6

Command: clear port_security_entry port 1:6

Success.

DGS-3400:4#

show port_security

Purpose	Used to display the current port security configuration.
Syntax	show port_security {ports <portlist>}
Description	This command is used to display port security information of the Switch's ports. The information displayed includes port security, admin state, maximum number of learning address and lock mode.
Parameters	<portlist> – Specifies a port or range of ports to be viewed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None.

Example usage:

To display the port security configuration:

DGS-3400:4#show port_security ports 1:1-1:5

Command: show port_security ports 1:1-1:5

Port	Admin State	Max. Learning Addr.	Lock Address Mode
1	Disabled	1	DeleteOnReset
2	Disabled	1	DeleteOnReset
3	Disabled	1	DeleteOnReset
4	Disabled	1	DeleteOnReset
5	Disabled	1	DeleteOnReset

STACKING COMMANDS

The stacking configuration commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config box_priority	current_box_id <value 1-12> priority <value 1-63>
config box_id	current_box_id <value 1-12> new_box_id [auto 1 2 3 4 5 6 7 8 9 10 11 12]
show stack_information	
config stacking mode	[disable enable]
show stacking mode	

Each command is listed, in detail, in the following sections.

config box_priority

Purpose	Used to configure box priority, which determines which box becomes the priority master. Lower numbers denote a higher priority.
Syntax	config box_priority {current_box_id <value 1-12> priority <value 1-63>}
Description	This command configures box (switch) priority.
Parameters	<i>current_box_id</i> <value 1-12> – Identifies the Switch being configured. Range is 1-12. <i>priority</i> <value 1-63> – Assigns a priority value to the box, with lower numbers having higher priority. The possible priority range is 1-63. This field is important when the stacking mode is automatically configured. Users who wish a certain switch become the primary master of the switch stack should configure their choice for the priority master switch to have the highest priority (and in essence the lowest number).
Restrictions	Only administrator-level users can issue this command.

Usage example:

To configure box priority:

```
DGS-3400:4#config box_priority current_box_id 1 priority 1
Command: config box_priority current_box_id 1 priority 1

Success.

DGS-3400:4#
```

config box_id

Purpose	Used to configure box ID. Users can use this command to reassign box IDs.
Syntax	config box_id {current_box_id <value 1-12> new_box_id [auto 1 2 3 4 5 6 7 8 9 10 11 12]}
Description	This command will assign box IDs to switches in a stack.
Parameters	<i>current_box_id</i> – Identifies the Switch being configured. Range is 1-12. <i>new_box_id</i> – The new ID being assigned to the Switch (box). Range is 1-12. <i>auto</i> – Allows the box ID to be assigned automatically.
Restrictions	Administrator privileges are needed to issue this command.

Usage example:

To change a box ID:

```
DGS-3400:4#config box_id current_box_id 1 new_box_id 2
Command: config box_id current_box_id 1 new_box_id 2

Success.

DGS-3400:4#
```

show stack_information

Purpose	Used to display the stack information table.
Syntax	show stack_information
Description	This command display stack information.
Parameters	None.
Restrictions	None.

Usage example:

To display stack information:

```
DGS-3400:4#show stack_information
```

Command: show stack_information

Topology : Duplex ring

My Box ID : 1

Master ID : 1

BK Master ID : 2

Box Count : 3

Box ID	User Set	Type	Exist	Prio- rity	MAC	Prom version	Runtime version	H/W version

10	-	Not Exist	no					
11	-	Not Exist	no					
12	-	Not Exist	no					

```
DGS-3400:4#
```

config stacking mode

Purpose	Used to configure the stacking mode.
Syntax	config stacking mode [disable enable]
Description	This command will enable or disable the stacking mode for the switch. When enabled, the 10G ports on the rear of the switch will be enabled for stacking.
Parameters	<i>enable</i> <i>disable</i> – Use these parameters to enable or disable the stacking mode for the switch. Once this command is executed, it will cause the switch to reboot. This mode cannot be changed when the switch is currently stacked with other switches.
Restrictions	Only administrator-level users can issue this command.

NOTE: Only ports 26 and 27 of the DGS-3427 support stacking. Port 25 cannot be used for stacking, and is to be used only as a 10-Gigabit uplink port.

Usage example:

To disable the stacking mode:

DGS-3400:4#config stacking mode disable

Command: config stacking mode disable

Change Box bootmode may cause devices work restart, still continue? (y/n)y

show stacking mode

Purpose	Used to view the current stacking mode.
Syntax	show stacking mode
Description	This command will display whether the current stacking mode is enabled or disabled.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Usage example:

To view the current stacking mode:

DGS-3400:#show stacking mode

Command: show stacking mode

Stacking mode : Enabled

DGS-3400:4#

NETWORK MANAGEMENT (SNMP) COMMANDS

The network management commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

The xStack DGS-3400 Series supports the Simple Network Management Protocol (SNMP) versions 1, 2c, and 3. Users may specify which version of SNMP to use to monitor and control the Switch. Three versions of SNMP vary in the level of security provided between the management station and the network device. The following table lists the security features of the three SNMP versions:

SNMP Version	Authentication Method	Description
v1	Community String	Community String is used for authentication – NoAuthNoPriv
v2c	Community String	Community String is used for authentication – NoAuthNoPriv
v3	Username	Username is used for authentication – NoAuthNoPriv
v3	MD5 or SHA	Authentication is based on the HMAC-MD5 or HMAC-SHA algorithms – AuthNoPriv
v3	MD5 DES or SHA DES	Authentication is based on the HMAC-MD5 or HMAC-SHA algorithms – AuthPriv. DES 56-bit encryption is added based on the CBC-DES (DES-56) standard

Command	Parameters
create snmp user	<username 32> <groupname 32> {encrypted [by_password auth [md5 <auth_password 8-16 > sha <auth_password 8-20 >] priv [none des <priv_password 8-16>] by_key auth [md5 <auth_key 32-32> sha <auth_key 40-40>] priv [none des <priv_key 32-32>]]}
delete snmp user	<username 32>
show snmp user	
create snmp view	<view_name 32> <oid> view_type [included excluded]
delete snmp view	<view_name 32> [all oid]
show snmp view	<view_name 32>
create snmp community	<community_string 32> view <view_name 32> [read_only read_write]
delete snmp community	<community_string 32>
show snmp community	<community_string 32>
config snmp engineID	<snmp_engineID 10-64>
show snmp engineID	
create snmp group	<groupname 32> {v1 v2c v3 [noauth_nopriv auth_nopriv auth_priv]} {read_view <view_name 32> write_view <view_name 32> notify_view <view_name 32>}
delete snmp group	<groupname 32>
show snmp groups	
create snmp	[host <ipaddr> v6host <ipv6addr>] [v1 v2c v3 [noauth_nopriv

Command	Parameters
	auth_nopriv auth_priv]] <auth_string 32>
delete snmp	[host <ipaddr> v6host <ipv6addr>]
show snmp host	{<ipaddr>}
show snmp v6host	{<ipv6addr>}
enable snmp traps	
enable snmp authenticate traps	
show snmp traps	
disable snmp traps	
disable snmp authenticate traps	
config snmp system_contact	<sw_contact>
config snmp system_location	<sw_location>
config snmp system_name	<sw_name>
enable rmon	
disable rmon	

Each command is listed, in detail, in the following sections.

create snmp user

Purpose	Used to create a new SNMP user and adds the user to an SNMP group that is also created by this command.
Syntax	create snmp user <username 32> <groupname 32> {encrypted [by_password auth [md5 <auth_password 8-16> sha <auth_password 8-20>] priv [none des <priv_password 8-16>] by_key auth [md5 <auth_key 32-32> sha <auth_key 40-40>] priv [none des <priv_key 32-32>]]}
Description	The create snmp user command creates a new SNMP user and adds the user to an SNMP group that is also created by this command. SNMP ensures: Message integrity – Ensures that packets have not been tampered with during transit. Authentication – Determines if an SNMP message is from a valid source. Encryption – Scrambles the contents of messages to prevent it from being viewed by an unauthorized source.
Parameters	<username 32> – An alphanumeric name of up to 32 characters that will identify the new SNMP user. <groupname 32> – An alphanumeric name of up to 32 characters that will identify the SNMP group the new SNMP user will be associated with. <i>encrypted</i> – Allows the user to choose a type of authorization for authentication using SNMP. The user may choose: <i>by_password</i> – Requires the SNMP user to enter a password for authentication and privacy. The password is defined by specifying the <i>auth_password</i> below. This method is recommended. <i>by_key</i> – Requires the SNMP user to enter a encryption key for authentication and privacy. The key is defined by specifying the key in hex form below. This method is not recommended. <i>auth</i> - The user may also choose the type of authentication algorithms used to authenticate the snmp user. The choices are:

create snmp user

md5 – Specifies that the HMAC-MD5-96 authentication level will be used. md5 may be utilized by entering one of the following:

- **<auth_password 8-16>** - An alphanumeric string of between 8 and 16 characters that will be used to authorize the agent to receive packets for the host.
- **<auth_key 32-32>** - Enter an alphanumeric string of exactly 32 characters, in hex form, to define the key that will be used to authorize the agent to receive packets for the host.

sha – Specifies that the HMAC-SHA-96 authentication level will be used.

- **<auth_password 8-20>** - An alphanumeric string of between 8 and 20 characters that will be used to authorize the agent to receive packets for the host.
- **<auth_key 40-40>** - Enter an alphanumeric string of exactly 40 characters, in hex form, to define the key that will be used to authorize the agent to receive packets for.

priv – Adding the priv (privacy) parameter will allow for encryption in addition to the authentication algorithm for higher security. The user may choose:

- **des** – Adding this parameter will allow for a 56-bit encryption to be added using the DES-56 standard using:
 - <priv_password 8-16>** - An alphanumeric string of between 8 and 16 characters that will be used to encrypt the contents of messages the host sends to the agent.
 - <priv_key 32-32>** - Enter an alphanumeric key string of exactly 32 characters, in hex form, that will be used to encrypt the contents of messages the host sends to the agent.
- **none** – Adding this parameter will add no encryption.

Restrictions Only administrator-level users can issue this command.

Example usage:

To create an SNMP user on the Switch:

```
DGS-3400:4#create snmp user dlink default encrypted by_password auth md5
canadian priv none
Command: create snmp user dlink default encrypted by_password auth md5
canadian priv none

Success.

DGS-3400:4#
```

delete snmp user

Purpose	Used to remove an SNMP user from an SNMP group and also to delete the associated SNMP group.
Syntax	delete snmp user <username 32>
Description	The delete snmp user command removes an SNMP user from its SNMP group and then deletes the associated SNMP group.
Parameters	<username 32> – An alphanumeric string of up to 32 characters that identifies the SNMP user that will be deleted.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a previously entered SNMP user on the Switch:

```
DGS-3400:4#delete snmp user dlink
Command: delete snmp user dlink

Success.

DGS-3400:4#
```

show snmp user

Purpose	Used to display information about each SNMP username in the SNMP group username table.
Syntax	show snmp user
Description	The show snmp user command displays information about each SNMP username in the SNMP group username table.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the SNMP users currently configured on the Switch:

```
DGS-3400:4#show snmp user
Command: show snmp user

Username          Group              VerAuthPriv
-----
initial           initial            V3NoneNone

Total Entries: 1

DGS-3400:4#
```

create snmp view

Purpose	Used to assign views to community strings to limit which MIB objects and SNMP manager can access.
Syntax	create snmp view <view_name 32> <oid> view_type [included excluded]
Description	The create snmp view command assigns views to community strings to limit which MIB objects an SNMP manager can access.
Parameters	<view_name 32> – An alphanumeric string of up to 32 characters that identifies the SNMP view that will be created. <oid> – The object ID that identifies an object tree (MIB tree) that will be included or excluded from access by an SNMP manager. view type – Sets the view type to be: <i>included</i> – Include this object in the list of objects that an SNMP manager can access. <i>excluded</i> – Exclude this object from the list of objects that an SNMP manager can access.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create an SNMP view:

```
DGS-3400:4#create snmp view dlinkview 1.3.6 view_type included
Command: create snmp view dlinkview 1.3.6 view_type included

Success.

DGS-3400:4#
```

delete snmp view

Purpose	Used to remove an SNMP view entry previously created on the Switch.
Syntax	delete snmp view <view_name 32> [all <oid>]
Description	The delete snmp view command is used to remove an SNMP view previously created on the Switch.
Parameters	<view_name 32> – An alphanumeric string of up to 32 characters that identifies the SNMP view to be deleted. all – Specifies that all of the SNMP views on the Switch will be deleted. <oid> – The object ID that identifies an object tree (MIB tree) that will be deleted from the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a previously configured SNMP view from the Switch:

```
DGS-3400:4#delete snmp view dlinkview all
Command: delete snmp view dlinkview all

Success.

DGS-3400:4#
```

show snmp view

Purpose	Used to display an SNMP view previously created on the Switch.
Syntax	show snmp view {<view_name 32>}
Description	The show snmp view command displays an SNMP view previously created on the Switch.
Parameters	<view_name 32> – An alphanumeric string of up to 32 characters that identifies the SNMP view that will be displayed.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display SNMP view configuration:

DGS-3400:4#show snmp view

Command: show snmp view

DGS-3400:4#

create snmp community

Purpose	Used to create an SNMP community string to define the relationship between the SNMP manager and an agent. The community string acts like a password to permit access to the agent on the Switch. One or more of the following characteristics can be associated with the community string: An Access List of IP addresses of SNMP managers that are permitted to use the community string to gain access to the Switch's SNMP agent. An MIB view that defines the subset of all MIB objects that will be accessible to the SNMP community. <i>read_write</i> or <i>read_only</i> level permission for the MIB objects accessible to the SNMP community.
Syntax	create snmp community <community_string 32> view <view_name 32> [read_only read_write]
Description	The create snmp community command is used to create an SNMP community string and to assign access-limiting characteristics to this community string.
Parameters	<community_string 32> – An alphanumeric string of up to 32 characters that is used to identify members of an SNMP community. This string is used like a password to give remote SNMP managers access to MIB objects in the Switch's SNMP agent. <view_name 32> – An alphanumeric string of up to 32 characters that is used to identify the group of MIB objects that a remote SNMP manager is allowed to access on the Switch. read_only – Specifies that SNMP community members using the community string created with this command can only read the contents of the MIBs on the Switch. read_write – Specifies that SNMP community members using the community string created with this command can read from and write to the contents of the MIBs on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create the SNMP community string "dlink:"

```
DGS-3400:4#create snmp community dlink view ReadView read_write
Command: create snmp community dlink view ReadView read_write

Success.

DGS-3400:4#
```

delete snmp community

Purpose	Used to remove a specific SNMP community string from the Switch.
Syntax	delete snmp community <community_string 32>
Description	The delete snmp community command is used to remove a previously defined SNMP community string from the Switch.
Parameters	<community_string 32> – An alphanumeric string of up to 32 characters that is used to identify members of an SNMP community. This string is used like a password to give remote SNMP managers access to MIB objects in the Switch's SNMP agent.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the SNMP community string "dlink:"

```
DGS-3400:4#delete snmp community dlink
Command: delete snmp community dlink

Success.

DGS-3400:4#
```

show snmp community

Purpose	Used to display SNMP community strings configured on the Switch.
Syntax	show snmp community <community_string 32>
Description	The show snmp community command is used to display SNMP community strings that are configured on the Switch.
Parameters	<community_string 32> – An alphanumeric string of up to 32 characters that is used to identify members of an SNMP community. This string is used like a password to give remote SNMP managers access to MIB objects in the Switch's SNMP agent.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the currently entered SNMP community strings:

```
DGS-3400:4#show snmp community
Command: show snmp community

SNMP Community Table

Community Name      View Name      Access Right
-----
dlink               ReadView      read_write
private            CommunityView read_write
public             CommunityView read_only

Total Entries: 3

DGS-3400:4#
```

config snmp engineID

Purpose	Used to configure a name for the SNMP engine on the Switch.
Syntax	config snmp engineID <snmp_engineID 10-64>
Description	The config snmp engineID command configures a name for the SNMP engine on the Switch.
Parameters	<snmp_engineID 10-64> – An alphanumeric string that will be used to identify the SNMP engine on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To give the SNMP agent on the Switch the name “0035636666”:

```
DGS-3400:4#config snmp engineID 0035636666
Command: config snmp engineID 0035636666

Success.

DGS-3400:4#
```

show snmp engineID

Purpose	Used to display the identification of the SNMP engine on the Switch.
Syntax	show snmp engineID
Description	The show snmp engineID command displays the identification of the SNMP engine on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the current name of the SNMP engine on the Switch:

```
DGS-3400:4#show snmp engineID
Command: show snmp engineID

SNMP Engine ID : 0035636666

DGS-3400:4#
```

create snmp group

Purpose	Used to create a new SNMP group, or a table that maps SNMP users to SNMP views.
Syntax	create snmp group <groupname 32> [v1 v2c v3 [noauth_nopriv auth_nopriv auth_priv]] {read_view <view_name 32> write_view <view_name 32> notify_view <view_name 32>}
Description	The create snmp group command creates a new SNMP group, or a table that maps SNMP users to SNMP views.
Parameters	<groupname 32> – An alphanumeric name of up to 32 characters that will identify the SNMP group the new SNMP user will be associated with. v1 – Specifies that SNMP version 1 will be used. The Simple Network Management Protocol (SNMP), version 1, is a network management protocol that provides a means to monitor and control network devices. v2c – Specifies that SNMP version 2c will be used. The SNMP v2c supports both centralized and distributed network management strategies. It includes improvements in the Structure of Management Information (SMI) and adds some security features. v3 – Specifies that the SNMP version 3 will be used. SNMP v3 provides secure access to devices through a combination of authentication and encrypting packets over the network. SNMP v3 adds: • Message integrity – Ensures that packets have not been tampered with during transit. • Authentication – Determines if an SNMP message is from a valid source. • Encryption – Scrambles the contents of messages to prevent it being viewed by an unauthorized source. noauth_nopriv – Specifies that there will be no authorization and no encryption of packets sent between the Switch and a remote SNMP manager. auth_nopriv – Specifies that authorization will be required, but there will be no encryption of packets sent between the Switch and a remote SNMP manager. auth_priv – Specifies that authorization will be required, and that packets sent between the Switch and a remote SNMP manager will be encrypted. read_view – Specifies that the SNMP group being created can request SNMP messages. write_view – Specifies that the SNMP group being created has write privileges. notify_view – Specifies that the SNMP group being created can receive SNMP trap messages generated by the Switch's SNMP agent. <view_name 32> – An alphanumeric string of up to 32 characters that is used to identify the group of MIB objects that a remote SNMP manager is allowed to access on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create an SNMP group named "sg1:"

```
DGS-3400:4#create snmp group sg1 v3 noauth_nopriv read_view v1
write_view v1 notify_view v1
Command: create snmp group sg1 v3 noauth_nopriv read_view v1
write_view v1 notify_view v1

Success.

DGS-3400:4#
```

delete snmp group

Purpose	Used to remove an SNMP group from the Switch.
Syntax	delete snmp group <groupname 32>
Description	The delete snmp group command is used to remove an SNMP group from the Switch.
Parameters	<groupname 32> – An alphanumeric name of up to 32 characters that will identify the SNMP group the new SNMP user will be associated with.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the SNMP group named “sg1”.

```
DGS-3400:4#delete snmp group sg1
Command: delete snmp group sg1
```

Success.

```
DGS-3400:4#
```

show snmp groups

Purpose	Used to display the group-names of SNMP groups currently configured on the Switch. The security model, level, and status of each group are also displayed.
Syntax	show snmp groups
Description	The show snmp groups command displays the group-names of SNMP groups currently configured on the Switch. The security model, level, and status of each group are also displayed.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the currently configured SNMP groups on the Switch:

```
DGS-3400:4#show snmp groups
Command: show snmp groups

```

create snmp host

Purpose	Used to create a recipient of SNMP traps generated by the Switch's SNMP agent.
Syntax	create snmp [host <ipaddr> v6host <ipv6addr>] [v1 v2c v3 [noauth_nopriv auth_nopriv auth_priv] <auth_string 32>]
Description	The create snmp host command creates a recipient of SNMP traps generated by the Switch's SNMP agent.
Parameters	<i>host <ipaddr></i> – The IPv4 address of the remote management station that will serve as the SNMP host for the Switch. <i>v6host <ipv6addr></i> – The IPv6 address of the remote management station that will serve as the SNMP host for the Switch. <i>v1</i> – Specifies that SNMP version 1 will be used. The Simple Network Management Protocol (SNMP), version 1, is a network management protocol that provides a means to monitor and control network devices. <i>v2c</i> – Specifies that SNMP version 2c will be used. The SNMP v2c supports both centralized and distributed network management strategies. It includes improvements in the Structure of Management Information (SMI) and adds some security features. <i>v3</i> – Specifies that the SNMP version 3 will be used. SNMP v3 provides secure access to devices through a combination of authentication and encrypting packets over the network. SNMP v3 adds: • Message integrity – ensures that packets have not been tampered with during transit. • Authentication – determines if an SNMP message is from a valid source. • Encryption – scrambles the contents of messages to prevent it being viewed by an unauthorized source. <i>noauth_nopriv</i> – Specifies that there will be no authorization and no encryption of packets sent between the Switch and a remote SNMP manager. <i>auth_nopriv</i> – Specifies that authorization will be required, but there will be no encryption of packets sent between the Switch and a remote SNMP manager. <i>auth_priv</i> – Specifies that authorization will be required, and that packets sent between the Switch and a remote SNMP manager will be encrypted. <i><auth_string 32></i> – An alphanumeric string used to authorize a remote SNMP manager to access the Switch's SNMP agent.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create an SNMP IPv4 host to receive SNMP messages:

```
DGS-3400:4#create snmp host 10.48.74.100 v3 auth_priv public
Command: create snmp host 10.48.74.100 v3 auth_priv public

Success.

DGS-3400:4#
```

To create an SNMP IPv6 host to receive SNMP messages:

```
DGS-3400:4#create snmp v6host FF::FF v3 noauth_nopriv initial
Command: create snmp v6host FF::FF v3 noauth_nopriv initial

Success.

DGS-3400:4#
```

delete snmp host

Purpose	Used to remove a recipient of SNMP traps generated by the Switch's SNMP agent.
Syntax	delete snmp [host <ipaddr> v6host <ipv6addr>]
Description	The delete snmp host command deletes a recipient of SNMP traps generated by the Switch's SNMP agent.
Parameters	<i>host <ipaddr></i> – The IPv4 address of the remote management station that will serve as the SNMP host for the Switch. <i>v6host <ipv6addr></i> - The IPv6 address of the remote management station that will serve as the SNMP host for the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete an IPv4 SNMP host entry:

```
DGS-3400:4#delete snmp host 10.48.74.100
Command: delete snmp host 10.48.74.100

Success.

DGS-3400:4#
```

To delete an IPv6 SNMP host entry:

```
DGS-3400:4#delete snmp v6host FF::FF
Command: delete snmp v6host FF::FF

Success.

DGS-3400:4#
```

show snmp host

Purpose	Used to display the recipient of SNMP traps generated by the Switch's SNMP agent.
Syntax	show snmp host {<ipaddr>}
Description	The show snmp host command is used to display the IP addresses and configuration information of remote SNMP managers that are designated as recipients of SNMP traps that are generated by the Switch's SNMP agent.
Parameters	<i><ipaddr></i> – The IP address of a remote SNMP manager that will receive SNMP traps generated by the Switch's SNMP agent.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the currently configured SNMP hosts on the Switch:

```
DGS-3400:4#show snmp host
Command: show snmp host

SNMP Host Table
Host IP Address  SNMP Version  Community Name/SNMPv3
User Name
-----
10.48.76.23      V2c           private
10.48.74.100     V3 authpriv   public

Total Entries: 2

DGS-3400:4#
```

show snmp v6host

Purpose	Used to display the IPv6 recipient of SNMP traps generated by the Switch's SNMP agent.
Syntax	show snmp v6host {<ipv6addr>}
Description	The show snmp v6host command is used to display the IPv6 addresses and configuration information of remote SNMP managers that are designated as recipients of SNMP traps that are generated by the Switch's SNMP agent.
Parameters	<i>v6host <ipv6addr></i> – The IPv6 address of a remote SNMP manager that will receive SNMP traps generated by the Switch's SNMP agent.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the currently configured IPv6 SNMP hosts on the Switch:

```
DGS-3400:4#show snmp host
Command: show snmp host

SNMP Host Table
-----
Host IPv6 Address : FF::FF
SNMP Version      : V3 na/np
CommunityName/SNMPv3 User Name : initial

Total Entries: 1

DGS-3400:4#
```

enable snmp traps

Purpose	Used to enable SNMP trap support.
Syntax	enable snmp traps
Description	The enable snmp traps command is used to enable SNMP trap support on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable SNMP trap support on the Switch:

DGS-3400:4#enable snmp traps

Command: enable snmp traps

Success.

DGS-3400:4#

Purpose	Used to enable SNMP authentication trap support.
Syntax	enable snmp authenticate traps
Description	This command is used to enable SNMP authentication trap support on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To turn on SNMP authentication trap support:

DGS-3400:4#enable snmp authenticate traps

Command: enable snmp authenticate traps

Success.

DGS-3400:4#

show snmp traps

Purpose	Used to show SNMP trap support on the Switch .
Syntax	show snmp traps
Description	This command is used to view the SNMP trap support status currently configured on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To view the current SNMP trap support:

DGS-3400:4#show snmp traps

Command: show snmp traps

SNMP Traps : Enabled

Authenticate Traps : Enabled

DGS-3400:4#

disable snmp traps

Purpose	Used to disable SNMP trap support on the Switch.
Syntax	disable snmp traps
Description	This command is used to disable SNMP trap support on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To prevent SNMP traps from being sent from the Switch:

```
DGS-3400:4#disable snmp traps
```

```
Command: disable snmp traps
```

```
Success.
```

```
DGS-3400:4#
```

disable snmp authenticate traps

Purpose	Used to disable SNMP authentication trap support.
Syntax	disable snmp authenticate traps
Description	This command is used to disable SNMP authentication support on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the SNMP authentication trap support:

```
DGS-3400:4#disable snmp authenticate traps
```

```
Command: disable snmp authenticate traps
```

```
Success.
```

```
DGS-3400:4#
```

config snmp system_contact

Purpose	Used to enter the name of a contact person who is responsible for the Switch.
Syntax	config snmp system_contact <sw_contact>
Description	The config snmp system_contact command is used to enter the name and/or other information to identify a contact person who is responsible for the Switch. A maximum of 255 character can be used.
Parameters	<sw_contact> - A maximum of 255 characters is allowed. A NULL string is accepted if there is no contact.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the Switch contact to "MIS Department II":

```
DGS-3400:4#config snmp system_contact MIS Department II
Command: config snmp system_contact MIS Department II

Success.

DGS-3400:4#
```

config snmp system_location

Purpose	Used to enter a description of the location of the Switch.
Syntax	config snmp system_location <sw_location>
Description	The config snmp system_location command is used to enter a description of the location of the Switch. A maximum of 255 characters can be used.
Parameters	<sw_location> - A maximum of 255 characters is allowed. A NULL string is accepted if there is no location desired.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the Switch location for “HQ 5F”:

```
DGS-3400:4#config snmp system_location HQ 5F
Command: config snmp system_location HQ 5F

Success.

DGS-3400:4#
```

config snmp system_name

Purpose	Used to configure the name for the Switch.
Syntax	config snmp system_name <sw_name>
Description	The config snmp system_name command configures the name of the Switch.
Parameters	<sw_name> - A maximum of 255 characters is allowed. A NULL string is accepted if no name is desired.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the Switch name for “DGS-3400 Switch”:

```
DGS-3400:4#config snmp system_name DGS-3400 Switch
Command: config snmp system_name DGS-3400 Switch

Success.

DGS-3400:4#
```

enable rmon

Purpose	Used to enable RMON on the Switch.
Syntax	enable rmon
Description	This command is used, in conjunction with the disable rmon command below, to enable and disable remote monitoring (RMON) on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable RMON:

```
DGS-3400:4#enable rmon
Command: enable rmon

Success.

DGS-3400:4#
```

disable rmon

Purpose	Used to disable RMON on the Switch.
Syntax	disable rmon
Description	This command is used, in conjunction with the enable rmon command above, to enable and disable remote monitoring (RMON) on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable RMON:

```
DGS-3400:4#disable rmon
Command: disable rmon

Success.

DGS-3400:4#
```

SWITCH UTILITY COMMANDS

The switch utility commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
download	[firmware_fromTFTP [<ipaddr> <ipv6addr>] <path_filename 64> {image_id <1-2>} {unit [all unitid 1-12]} cfg_fromTFTP [<ipaddr> <ipv6addr>] <path_filename 64> {<config_id 1-2> increment}]
config firmware image	unit [unitid 1-12] <image_id <int 1-2> [delete boot_up]
show firmware information	
config configuration	<config_id 1-2> [boot_up delete active]
show config	[current_config config_in_nvr <config_id 1-2> information]
upload	[cfg_toTFTP [<ipaddr> <ipv6addr>] <path_filename 64> {<config_id 1-2>} log_toTFTP [<ipaddr> <ipv6addr>] <path_filename 64> attack_log_toTFTP [<ipaddr> <ipv6addr>] <path_filename 64>] {unit <unit_id 1-12>}]
clear attack_log	{[unit <unit_id 1-12> all]}
show attack_log	{unit <unit_id 1-12>} {index <value_list>}
enable autoconfig	
disable autoconfig	
show autoconfig	
ping	<ipaddr> {times <value 0-255>} {timeout <sec 1-99>}
ping6	<ipv6addr> {times <value 0-255> size <value 1-6000> timeout <value 1-10>}

Each command is listed, in detail, in the following sections.

download

Purpose	Used to download and install new firmware or a Switch configuration file from a TFTP server.
Syntax	download [firmware_fromTFTP [<ipaddr> <ipv6addr>] <path_filename 64> {image_id <1-2>} {unit [all unitid 1-12]} cfg_fromTFTP [<ipaddr> <ipv6addr>] <path_filename 64> {<config_id 1-2> increment}]
Description	This command is used to download a new firmware or a switch configuration file from a TFTP server.
Parameters	<i>firmware_fromTFTP</i> – Download and install new firmware on the Switch from a TFTP server. <i>cfg_fromTFTP</i> – Download and install a new configuration file on the Switch from a TFTP server. <i>image_id</i> - Specifies the image index ID number of the firmware in the Switch's memory. The Switch can store 2 firmware images for use. Image ID 1 will be the default boot up firmware for the Switch unless otherwise configured by the user. <i>unit [all <unitid 1-12>]</i> - <i>all</i> specifies all units (switches), <i><unitid></i> is the unit ID of the switch in the switch stack that will receive the download. This parameter is for downloading firmware only. <i>config</i> – Download a switch configuration file from a TFTP server.

download

- *<ipaddr>* – The IPv4 address of the TFTP server.
- *<ipv6addr>* – The IPv6 address of the TFTP server.
- *<path_filename 64>* – The DOS path and filename of the firmware or switch configuration file on the TFTP server. For example, C:\dgs3427.had.
- *config_id <int 1-2>* - The Switch can hold two configuration files specified by section ID. If no config_id is specified, the configuration being downloaded is applied to the system. If a config_id is specified, the configuration being downloaded is saved only to flash memory in the chosen section (1 or 2) and will not be applied to the system. Keep in mind that config_id 1 is the boot up configuration unless this is changed using the config configuration command.
- *increment* – Allows the download of a partial switch configuration file. This allows a file to be downloaded that will change only the switch parameters explicitly stated in the configuration file. All other switch parameters will remain unchanged.

Restrictions Only administrator-level users can issue this command.

Example usage:

To download a configuration file:

```
DGS-3400:4#download configuration 10.48.74.121 unit all c:\cfg\setting.txt
Command: download configuration 10.48.74.121 unit all c:\cfg\setting.txt

Connecting to server..... Done.
Download configuration..... Done.

```

config configuration

Purpose	Used to designate a stored configuration file section ID as a boot up configuration, active configuration or to delete the configuration file.
Syntax	config configuration <config_id 1-2> [boot_up delete active]
Description	This command is used to configure the section ID index of a stored configuration as the boot up or active configuration, or to delete the contents of the specified configuration section.
Parameters	<i>config_id</i> – Specifies the section being configured or deleted. <i>delete</i> – Entering this parameter will delete the contents of the specified section. <i>boot_up</i> – Entering specifies the configuration section as a boot up section. <i>active</i> – Entering specifies the configuration section as an active section.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure configuration section 1 as a boot up section:

```
DGS-3400:4#config configuration 1 boot_up
Command: config configuration 1 boot_up

Success.

DGS-3400:4#
```

config firmware

Purpose	Used to configure the firmware section as a boot up section, or to delete the firmware section
Syntax	config firmware {unit <unit_id 1-12> image_id <int 1-2> [delete boot_up]}
Description	This command is used to configure the firmware section. The user may choose to remove the firmware section or use it as a boot up section.
Parameters	<i>unit <unit_id 1-12></i> - Select the switch in the switch stack for which to configure the firmware image. <i>image_id</i> – Specifies the working section. The Switch can hold two firmware versions for the user to select from, which are specified by image ID. <i><int 1-2></i> - Select the ID number of the firmware in the Switch's memory to be configured. <i>delete</i> – Entering this parameter will delete the specified firmware section. <i>boot_up</i> – Entering this parameter will specify the firmware image ID as a boot up section.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure firmware section 1 as a boot up section:

```
DGS-3400:4#config firmware unit 1 image_id 1 boot_up
Command: config firmware unit 1 image_id 1 boot_up

Success.

DGS-3400:4#
```

show firmware information

Purpose	Used to display the firmware section information.
Syntax	show firmware information
Description	This command is used to display the firmware section information.
Parameters	None.
Restrictions	None

Example usage:

To display the current firmware information on the Switch:

```
DGS-3400:4#show firmware information
Command: show firmware information
```

Box ID	ID	Version	Size(B)	Update Time	From	User
---	--	-----	-----	-----	-----	-----

DGS-3400:4#
```

show config

Purpose	Used to display the current or saved version of the configuration settings of the switch.																																						
Syntax	show config [current_config config_in_nvram <config_id 1-2> information]																																						
Description	Use this command to display all the configuration settings that are saved to NV RAM or display the configuration settings as they are currently configured. Use the keyboard to list settings one line at a time (Enter), one page at a time (Space) or view all (a). The configuration settings are listed by category in the following order: <table> <tr><td>1. Stack</td><td>20. TR</td></tr> <tr><td>2. Double VLAN</td><td>21. ACL</td></tr> <tr><td>3. Basic (serial port, Telnet and web management status)</td><td>22. FDB (forwarding data base)</td></tr> <tr><td>4. Account List</td><td>23. Address Binding</td></tr> <tr><td>5. storm control</td><td>24. MAC Address Table Notification</td></tr> <tr><td>6. IP group management</td><td>25. STP</td></tr> <tr><td>7. syslog</td><td>26. SAFEGUARD ENGINE</td></tr> <tr><td>8. QoS</td><td>27. BANNER PROMPT</td></tr> <tr><td>9. port mirroring</td><td>28. SSH</td></tr> <tr><td>10. traffic segmentation</td><td>29. SNTP</td></tr> <tr><td>11. SSL</td><td>30. LACP</td></tr> <tr><td>12. port</td><td>31. IP and auto config</td></tr> <tr><td>13. PoE</td><td>32. IGMP Snooping</td></tr> <tr><td>14. Port lock</td><td>33. MLD Snooping</td></tr> <tr><td>15. SNMPv3</td><td>34. ACCESS AUTHENTICATION CONTROL</td></tr> <tr><td>16. MANAGEMENT</td><td>35. DHCP Relay</td></tr> <tr><td>17. VLAN</td><td>36. IPv6 Neighbor Detection</td></tr> <tr><td>18. 802.1X</td><td>37. ARP</td></tr> <tr><td>19. Guest VLAN</td><td>38. Route</td></tr> </table>	1. Stack	20. TR	2. Double VLAN	21. ACL	3. Basic (serial port, Telnet and web management status)	22. FDB (forwarding data base)	4. Account List	23. upload

Purpose	Used to upload switch settings or the switch history log to a TFTP.
Syntax	upload [cfg_toTFTP [<ipaddr> <ipv6addr>] <path_filename 64> {<config_id 1-2>} log_toTFTP [<ipaddr> <ipv6addr>] <path_filename 64>] attack_log_toTFTP [<ipaddr> <ipv6addr>] <path_filename 64>] {unit <unit_id 1-12>}]
Description	This command is used to upload either the Switch's current settings or the Switch's history log to a TFTP server.
Parameters	cfg_toTFTP – Specifies that the Switch's current settings will be uploaded to the TFTP server. • <ipaddr> – The IPv4 address of the TFTP server. The TFTP server must be on the same IP subnet as the Switch. • <ipv6addr> – The IPv6 address of the TFTP server. The TFTP server must be on the same IP subnet as the Switch. • <path_filename 64> – Specifies the location of the Switch configuration file on the TFTP server. This file will be replaced by the uploaded file from the Switch. • <config_id 1-2> - Entering this parameter will upload configurations to be specified, which were saved in NV-RAM to TFTP server. log_toTFTP – Specifies that the switch history log will be uploaded to the TFTP server. • <ipaddr> – The IP address of the TFTP server. The TFTP server must be on the same IP subnet as the Switch. • <ipv6addr> – The IPv6 address of the TFTP server. The TFTP server must be on the same IP subnet as the Switch. • <path_filename 64> – Specifies the location of the Switch configuration file on the TFTP server. This file will be replaced by the uploaded file from the Switch. attack_log_toTFTP - This command is used to upload a switch attack log to a TFTP server, such as a spoofing attack. • <ipaddr> - Enter the IPv4 address of the TFTP server to which to upload the attack log. • <ipv6addr> - Enter the IPv6 address of the TFTP server to which to

upload

upload the attack log.

- **<path_filename 64>** - Specifies the location of the Switch configuration file on the TFTP server. This file will be replaced by the uploaded file from the Switch.
- **unit <unit_id 1-12>** - Select the switch in the switch stack from where these attack log files will be uploaded, denoted by unit ID number.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To upload a configuration file:

```
DGS-3400:4#upload config 10.48.74.121 c:\cfg\log.txt
Command: upload config 10.48.74.121 c:\cfg\log.txt

Connecting to server..... Done.
Upload configuration.....Done.

DGS-3400:4#
```

Example usage:

To upload an attack log file:

```
DGS-3400:4#upload attack_log_toTFTP 10.53.13.23 c:\attacklog1 unit 1
Command: upload attack_log_toTFTP 10.53.13.23 c:\attacklog1 unit 1

Connecting to server..... Done.
Upload attack log.....Done.

DGS-3400:4#
```

show attack_log

Purpose	Used to display the switch history of attack log files.
Syntax	show attack_log {unit <unit_id 1-12>} {index <value_list>}
Description	This command will display the contents of the attack log of the Switch. This log displays the time and date of a possible attack on the switch, such as a spoofing attack.
Parameters	unit <unit_id 1-12> - Select the switch in the switch stack for which to view attack log files. index <value list> – This command will display the history log, beginning at 1 and ending at the value specified by the user in the <value_list> field. If no parameter is specified, all history log entries will be displayed.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the attack log:

DGS-3400:4#show attack_log index 1-2

Command: show attack_log index 1-2

Index	Date	Time	Log Text
2	2006-04-25	12:38:00	Possible spoofing attack from 000d010023001 port 1:23
1	2006-04-25	12:37:42	Possible spoofing attack from 000d010023001 port 1:23

DGS-3400:4#

clear attack_log

Purpose	Used to clear the switch history of attack log files.
Syntax	clear attack_log {[unit <unit_id 1-12> all]}
Description	This command will clear the contents of the attack log of the Switch.
Parameters	<i>unit</i> <unit_id 1-12> - Select the switch in the switch stack for which to clear attack log files. <i>all</i> – Entering this parameter will clear all attack log files in the switch stack.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To clear the attack log for all switches in the switch stack:

DGS-3400:4#clear attack_log all

Command: clear attack_log all

Success.

DGS-3400:4#

enable autoconfig

Purpose	Used to activate the autoconfiguration function for the Switch. This will load a configuration from the TFTP server specified in the reply.
Syntax	enable autoconfig
Description	When autoconfig is enabled on the Switch, the DHCP reply will contain a configuration file and path name. It will then request the file from the TFTP server specified in the reply. When autoconfig is enabled, the ipif settings will automatically become DHCP client.
Parameters	None.
Restrictions	When autoconfig is enabled, the Switch becomes a DHCP client automatically (same as: config ipif System dhcp). The DHCP server must have the TFTP server IP address and configuration file name, and be configured to deliver this information in the data field of the DHCP reply packet. The TFTP server must be running and have the requested configuration file in its base directory when the request is received from the Switch. Consult the DHCP server and TFTP server software instructions for information on loading a configuration file. If the Switch is unable to complete the autoconfiguration process the previously saved local configuration file present in Switch memory will be loaded.

NOTE: Dual-purpose (DHCP/TFTP) server utility software may require entry of the configuration file name and path within the user interface. Alternatively, the DHCP software may require creating a separate ext file with the configuration file name and path in a specific directory on the server. Consult the documentation for the DHCP server software if unsure.

Example usage:

To enable autoconfiguration on the Switch:

```
DGS-3400:4#enable autoconfig
Command: enable autoconfig

Success.

DGS-3400:4#
```

When autoconfig is enabled and the Switch is rebooted, the normal login screen will appear for a few moments while the autoconfig request (i.e. download configuration) is initiated. The console will then display the configuration parameters as they are loaded from the configuration file specified in the DHCP or TFTP server. This is exactly the same as using a **download config** command. After the entire Switch configuration is loaded, the Switch will automatically “logout” the server.

Upon booting up the autoconfig process is initiated, the console screen will appear similar to the example below. The configuration settings will be loaded in normal order.

```

DGS-3400 Gigabit Ethernet Switch
Command Line Interface

Firmware: Build 2.00-B46
Copyright(C) 2004-2007 D-Link Corporation. All rights reserved.

DGS-3400:4#
DGS-3400:4#
DGS-3400:4#download config 10.41.44.44 c:\cfg\setting.txt
Command: download config 10.41.44.44 c:\cfg\setting.txt

Connecting to server..... Done.
Download configuration..... Done.
```

The very end of the autoconfig process including the logout appears like this:

```

DGS-3400:4# create iproute default 172.18.212.253 1
Command: create iproute default 172.18.212.253 1

Success.

DGS-3400:4#
DGS-3400:4##-----
DGS-3400:4##          End of configuration file for DGS-3400
DGS-3400:4#

*****
* Logout *
*****
```

NOTE: With autoconfig enabled, the Switch ipif settings now define the Switch as a DHCP client. Use the **show switch** command to display the new IP settings status.

disable autoconfig

Purpose	Use this to deactivate autoconfiguration from DHCP.
Syntax	disable autoconfig
Description	This instructs the Switch not to accept autoconfiguration instruction from the DHCP server. This does not change the IP settings of the Switch. The ipif settings will continue as DHCP client until changed with the config ipif command.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To stop the autoconfiguration function:

```
DGS-3400:4#disable autoconfig
Command: disable autoconfig

Success.

DGS-3400:4#
```

show autoconfig

Purpose	Used to display the current autoconfig status of the Switch.
Syntax	show autoconfig
Description	This will list the current status of the autoconfiguration function.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To view the autoconfiguration status:

```
DGS-3400:4#show autoconfig
Command: show autoconfig

Autoconfig State: Disabled.

DGS-3400:4#
```

ping

Purpose	Used to test the connectivity between network devices.
Syntax	ping <ipaddr> {times <value 1-255>} {timeout <sec 1-99>}
Description	The ping command sends Internet Control Message Protocol (ICMP) echo messages to a remote IP address. The remote IP address will then “echo” or return the message. This is used to confirm connectivity between the Switch and the remote device.
Parameters	<ipaddr> - Specifies the IP address of the host. times <value 1-255> - The number of individual ICMP echo messages to be sent. The maximum value is 255. timeout <sec 1-99> - Defines the time-out period while waiting for a response from the remote device. A value of 1 to 99 seconds can be specified. The default is 1 second
Restrictions	None.

Example usage:

To ping the IP address 10.48.74.121 four times:

```
DGS-3400:4#ping 10.48.74.121 times 4
Command: ping 10.48.74.121

Reply from 10.48.74.121, time<10ms
Reply from 10.48.74.121, time<10ms
Reply from 10.48.74.121, time<10ms
Reply from 10.48.74.121, time<10ms

Ping statistics for 10.48.74.121
Packets: Sent =4, Received =4, Lost =0

DGS-3400:4#
```

ping6

Purpose	Used to test the connectivity between IPv6 ready network devices.
Syntax	ping6 <ipv6addr> {times <value 0-255> size <value 1-6000>} {timeout <value 1-10>}
Description	The ping6 command sends Internet Control Message Protocol (ICMPv6) echo messages to a remote IPv6 address. The remote IP address will then “echo” or return the message. This is used to confirm connectivity between the Switch and the remote device.
Parameters	<ipv6addr> - Specifies the IP address of the host. times <value 0-255> - The number of individual ICMP echo messages to be sent. The maximum value is 255. size <value 1-6000> - Use this parameter to set the datagram size of the packet, or in essence, the number of bytes in each ping packet. Users may set a size between 1 and 6000 bytes with a default setting of 100 bytes. timeout <value 1-10> - Select a timeout period between 1 and 10 seconds for this Ping message to reach its destination. If the packet fails to find the IPv6 address in this specified time, the Ping packet will be dropped.
Restrictions	None.

Example usage:

To ping the IPv6 address 2009::280:C8FF:FE3C:5C8A four times:

```
DGS-3400:4#ping6 2009::280:C8FF:FE3C:5C8A times 4 timeout 100
Command: ping6 2009::280:C8FF:FE3C:5C8A times 4 timeout 100

Reply from 2009::280:C8FF:FE3C:5C8A, bytes=100 time<10 ms
Reply from 2009::280:C8FF:FE3C:5C8A, bytes=100 time<10 ms
Reply from 2009::280:C8FF:FE3C:5C8A, bytes=100 time<10 ms

```

NETWORK MONITORING COMMANDS

The network monitoring commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
show packet ports	<portlist>
show error ports	<portlist>
show utilization	[ports cpu]
clear counters	{ports <portlist>}
clear log

Each command is listed, in detail, in the following sections.

show packet ports

Purpose	Used to display statistics about the packets sent and received by the Switch.
Syntax	show packet ports <portlist>
Description	This command is used to display statistics about packets sent and received by ports specified in the <portlist>.
Parameters	<portlist> – Specifies a port or range of ports to be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a

show packet ports

comma. (ex: 1:1-1:3,1:7-1:9)

Restrictions None.

Example usage:

To display the packets analysis for port 7 of switch 1:

DGS-3400:4#show packet ports 1:7**Command: show packet ports 1:7****Port number :1:7**

Frame Size/Type	Frame Counts	Frames/sec
64	3275	10
65-127	755	10
128-255	316	1
256-511	145	0
512-1023	15	0
1024-1518	0	0
Unicast RX	152	1
Multicast RX	557	2
Broadcast RX	3686	16

Frame Type	Total	Total/sec
RX Bytes	408973	1657
RX Frames	395	19
TX Bytes	7918	178
TX Frames	111	2

CTRL+C ESC q Quit SPACE n Next Page p Previous Page r Refresh

show error ports

Purpose	Used to display the error statistics for a range of ports.
Syntax	show error ports <portlist>
Description	This command will display all of the packet error statistics collected and logged by the Switch for a given port list.
Parameters	<portlist> – Specifies a port or range of ports to be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None.

Example usage:

To display the errors of the port 3 of switch 1:

DGS-3400:4#show error ports 1:3

Command: show error ports 1:3

Port number : 1:3

	RX Frames		TX Frames
	-----		-----
CRC Error	19	Excessive Deferral	0
Undersize	0	CRC Error	0
Oversize	0	Late Collision	0
Fragment	0	Excessive Collision	0
Jabber	11	Single Collision	0
Drop Pkts	20837	Collision	0
Symbol Error	0		

CTRL+C ESC q Quit SPACE n Next Page p Previous Page r Refresh

show utilization

Purpose	Used to display real-time port and CPU utilization statistics.
Syntax	show utilization [ports cpu]
Description	This command will display the real-time port and cpu utilization statistics for the Switch.
Parameters	<i>ports</i> - Entering this parameter will display the current port utilization of the Switch. <i>cpu</i> - Entering this parameter will display the current CPU utilization of the Switch.
Restrictions	None.

Example usage:

To display the port utilization statistics:

DGS-3400:4#show utilization ports

Command: show utilization ports

Port	TX/sec	RX/sec	Util	Port	TX/sec	RX/sec	Util
----	-----	-----	----	----	-----	-----	----
1:1	0	0	0	1:22	0	0	0
1:2	0	0	0	1:23	0	0	0
1:3	0	0	0	1:24	0	0	0
1:4	0	0	0	2:1	0	26	1
1:5	0	0	0	2:2	0	26	1
1:6	0	0	0	2:3	0	26	1
1:7	0	0	0	2:4	0	26	1
1:8	0	0	0	2:5	0	26	1
1:9	0	0	0	2:6	0	26	1

clear counters

Purpose	Used to clear the Switch's statistics counters.
Syntax	clear counters {ports<portlist>}
Description	This command will clear the counters used by the Switch to compile statistics.
Parameters	<i>ports <portlist></i> – Specifies a port or range of ports to be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To clear the counters:

```
DGS-3400:4#clear counters ports 1:2-1:9
Command: clear counters ports 1:2-1:9

Success.

DGS-3400:4#
```

clear log

Purpose	Used to clear the Switch's history log.
Syntax	clear log
Description	This command will clear the Switch's history log.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To clear the log information:

```
DGS-3400:4#clear log
```

```
Command: clear log
```

```
Success.
```

```
DGS-3400:4#
```

show log

Purpose	Used to display the switch history log.
Syntax	show log {index <value_list>}
Description	This command will display the contents of the Switch's history log.
Parameters	<i>index <value list></i> – This command will display the history log, beginning at 1 and ending at the value specified by the user in the <i><value_list></i> field. If no parameter is specified, all history log entries will be displayed.
Restrictions	None.

Example usage:

To display the switch history log:

```
DGS-3400:4#show log index 1-5
```

```
Command: show log index 1-5
```

Index	Date	Time	Log Text
5	2006-04-26	09:38:18	Successful login through Console (Username: Anonymous)
4	2006-04-26	09:36:20	System started up
3	2006-04-25	12:38:18	Port 1 link up, 100Mbps FULL duplex
2	2006-04-25	12:38:00	Spanning Tree Protocol is disabled
1	2006-04-25	12:37:42	Configuration saved to flash (Username: Anonymous)

```
DGS-3400:4#
```

enable syslog

Purpose	Used to enable the system log to be sent to a remote Syslog server.
Syntax	enable syslog
Description	The enable syslog command enables the system log to be sent to a remote Syslog server.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable the Syslog function on the Switch:

```
DGS-3400:4#enable syslog
```

```
Command: enable syslog
```

```
Success.
```

```
DGS-3400:4#
```

disable syslog

Purpose	Used to disable the system log to be sent to a remote System log.
Syntax	disable syslog
Description	The disable syslog command disables the system log to be sent to a remote Syslog server.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the Syslog function on the Switch:

```
DGS-3400:4#disable syslog
Command: disable syslog

Success.

DGS-3400:4#
```

create syslog host

Purpose	Used to create a new Syslog host.																		
Syntax	create syslog host <index 1-4> {severity [informational warning all] facility [local0 local1 local2 local3 local4 local5 local6 local7] udp_port <udp_port_number> ipaddress <ipaddr> state [enable disable]}																		
Description	The create syslog host command is used to create a new Syslog host.																		
Parameters	<index 1-4> – Specifies that the command will be applied to an index of hosts. There are four available indexes, numbered 1 through 4. severity – Severity level indicator, as shown below: Bold font indicates that the corresponding severity level is currently supported on the Switch. <table> <thead> <tr> <th>Numerical Code</th><th>Severity</th></tr> </thead> <tbody> <tr> <td>0</td><td>Emergency: system is unusable</td></tr> <tr> <td>1</td><td>Alert: action must be taken immediately</td></tr> <tr> <td>2</td><td>Critical: critical conditions</td></tr> <tr> <td>3</td><td>Error: error conditions</td></tr> <tr> <td>4</td><td>Warning: warning conditions</td></tr> <tr> <td>5</td><td>Notice: normal but significant condition</td></tr> <tr> <td>6</td><td>Informational: informational messages</td></tr> <tr> <td>7</td><td>Debug: debug-level messages</td></tr> </tbody> </table> informational – Specifies that informational messages will be sent to the remote host. This corresponds to number 6 from the list above. warning – Specifies that warning messages will be sent to the remote host. This corresponds to number 4 from the list above. all – Specifies that all of the currently supported syslog messages that are generated by the Switch will be sent to the remote host. facility – Some of the operating system daemons and processes have been assigned Facility values. Processes and daemons that have not been explicitly assigned a Facility may use any of the "local use" facilities or they may use the "user-level" Facility. Those Facilities that have been designated are shown in the following: Bold font indicates the facility values that the Switch currently supports.	Numerical Code	Severity	0	Emergency: system is unusable	1	Alert: action must be taken immediately	2	Critical: critical conditions	3	Error: error conditions	4	Warning: warning conditions	5	Notice: normal but significant condition	6	Informational: informational messages	7	Debug: debug-level messages
Numerical Code	Severity																		
0	Emergency: system is unusable																		
1	Alert: action must be taken immediately																		
2	Critical: critical conditions																		
3	Error: error conditions																		
4	Warning: warning conditions																		
5	Notice: normal but significant condition																		
6	Informational: informational messages																		
7	Debug: debug-level messages																		

create syslog host

Numerical Code	Facility
0	kernel messages
1	user-level messages
2	mail system
3	system daemons
4	security/authorization messages
5	messages generated internally by syslog
6	line printer subsystem
7	network news subsystem
8	UUCP subsystem
9	clock daemon
10	security/authorization messages
11	FTP daemon
12	NTP subsystem
13	log audit
14	log alert
15	clock daemon
16	local use 0 (local0)
17	local use 1 (local1)
18	local use 2 (local2)
19	local use 3 (local3)
20	local use 4 (local4)
21	local use 5 (local5)
22	local use 6 (local6)
23	local use 7 (local7)

local0 – Specifies that local use 0 messages will be sent to the remote host. This corresponds to number 16 from the list above.

local1 – Specifies that local use 1 messages will be sent to the remote host. This corresponds to number 17 from the list above.

local2 – Specifies that local use 2 messages will be sent to the remote host. This corresponds to number 18 from the list above.

local3 – Specifies that local use 3 messages will be sent to the remote host. This corresponds to number 19 from the list above.

local4 – Specifies that local use 4 messages will be sent to the remote host. This corresponds to number 20 from the list above.

local5 – Specifies that local use 5 messages will be sent to the remote host. This corresponds to number 21 from the list above.

local6 – Specifies that local use 6 messages will be sent to the remote host. This corresponds to number 22 from the list above.

local7 – Specifies that local use 7 messages will be sent to the remote host. This corresponds to number 23 from the list above.

udp_port <udp_port_number> – Specifies the UDP port number that the syslog protocol will use to send messages to the remote host.

ipaddress <ipaddr> – Specifies the IP address of the remote host where syslog messages will be sent. Only IPv4 addresses are supported for this feature.

state [enable | disable] – Allows the sending of syslog messages to the remote host, specified above, to be enabled and disabled.

Restrictions Only administrator-level users can issue this command.

Example usage:

To create a Syslog host:

```
DGS-3400:4#create syslog host 1 ipaddress 10.1.1.1 state enable
Command: create syslog host 1 ipaddress 10.1.1.1 state enable

Success.

DGS-3400:4#
```

config syslog host

Purpose	Used to configure the Syslog protocol to send system log data to a remote host.																																																		
Syntax	config syslog host <index 1-4> [severity [informational warning all] facility [local0 local1 local2 local3 local4 local5 local6 local7] udp_port<udp_port_number> ipaddress <ipaddr> state [enable disable]]																																																		
Description	The config syslog host command is used to configure the syslog protocol to send system log information to a remote host.																																																		
Parameters	<index 1-4> – Specifies that the command will be applied to an index of hosts. There are four available indexes, numbered 1 through 4. <i>severity</i> – Severity level indicator. These are described in the following: Bold font indicates that the corresponding severity level is currently supported on the Switch. <table> <tr> <th>Numerical</th><th>Severity</th></tr> <tr> <td>Code</td><td></td></tr> <tr> <td>0</td><td>Emergency: system is unusable</td></tr> <tr> <td>1</td><td>Alert: action must be taken immediately</td></tr> <tr> <td>2</td><td>Critical: critical conditions</td></tr> <tr> <td>3</td><td>Error: error conditions</td></tr> <tr> <td>4</td><td>Warning: warning conditions</td></tr> <tr> <td>5</td><td>Notice: normal but significant condition</td></tr> <tr> <td>6</td><td>Informational: informational messages</td></tr> <tr> <td>7</td><td>Debug: debug-level messages</td></tr> </table> <i>informational</i> – Specifies that informational messages will be sent to the remote host. This corresponds to number 6 from the list above. <i>warning</i> – Specifies that warning messages will be sent to the remote host. This corresponds to number 4 from the list above. <i>all</i> – Specifies that all of the currently supported syslog messages that are generated by the Switch will be sent to the remote host. <i>facility</i> – Some of the operating system daemons and processes have been assigned Facility values. Processes and daemons that have not been explicitly assigned a Facility may use any of the "local use" facilities or they may use the "user-level" Facility. Those Facilities that have been designated are shown in the following: Bold font indicates the facility values the Switch currently supports. <table> <tr> <th>Numerical</th><th>Facility</th></tr> <tr> <td>Code</td><td></td></tr> <tr> <td>0</td><td>kernel messages</td></tr> <tr> <td>1</td><td>user-level messages</td></tr> <tr> <td>2</td><td>mail system</td></tr> <tr> <td>3</td><td>system daemons</td></tr> <tr> <td>4</td><td>security/authorization messages</td></tr> <tr> <td>5</td><td>messages generated internally by syslog</td></tr> <tr> <td>6</td><td>line printer subsystem</td></tr> <tr> <td>7</td><td>network news subsystem</td></tr> <tr> <td>8</td><td>UUCP subsystem</td></tr> <tr> <td>9</td><td>clock daemon</td></tr> <tr> <td>10</td><td>security/authorization messages</td></tr> <tr> <td>11</td><td>FTP daemon</td></tr> <tr> <td>12</td><td>NTP subsystem</td></tr> </table>	Numerical	Severity	Code		0	Emergency: system is unusable	1	Alert: action must be taken immediately	2	Critical: critical conditions	3	Error: error conditions	4	Warning: warning conditions	5	Notice: normal but significant condition	6	Informational: informational messages	7	Debug: debug-level messages	Numerical	Facility	Code		0	kernel messages	1	user-level messages	2	mail system	3	system daemons	4	security/authorization messages	5	messages generated internally by syslog	6	line printer subsystem	7	network news subsystem	8	UUCP subsystem	9	clock daemon	10	security/authorization messages	11	FTP daemon	12	NTP subsystem

config syslog host

- 13 log audit
- 14 log alert
- 15 clock daemon
- 16 local use 0 (local0)
- 17 local use 1 (local1)
- 18 local use 2 (local2)
- 19 local use 3 (local3)
- 20 local use 4 (local4)
- 21 local use 5 (local5)
- 22 local use 6 (local6)
- 23 local use 7 (local7)

local0 – Specifies that local use 0 messages will be sent to the remote host. This corresponds to number 16 from the list above.

local1 – Specifies that local use 1 messages will be sent to the remote host. This corresponds to number 17 from the list above.

local2 – Specifies that local use 2 messages will be sent to the remote host. This corresponds to number 18 from the list above.

local3 – Specifies that local use 3 messages will be sent to the remote host. This corresponds to number 19 from the list above.

local4 – Specifies that local use 4 messages will be sent to the remote host. This corresponds to number 20 from the list above.

local5 – Specifies that local use 5 messages will be sent to the remote host. This corresponds to number 21 from the list above.

local6 – Specifies that local use 6 messages will be sent to the remote host. This corresponds to number 22 from the list above.

local7 – Specifies that local use 7 messages will be sent to the remote host. This corresponds to number 23 from the list above.

udp_port <udp_port_number> – Specifies the UDP port number that the syslog protocol will use to send messages to the remote host.

ipaddress <ipaddr> – Specifies the IP address of the remote host where syslog messages will be sent. Only IPv4 addresses are supported for this feature.

state [enable | disable] – Allows the sending of syslog messages to the remote host, specified above, to be enabled and disabled.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure a Syslog host:

DGS-3400:4#config syslog host 1 severity all

Command: config syslog host 1 severity all

Success.

DGS-3400:4#config syslog host 1 facility local0

Command: config syslog host 1 facility local0

Success.

DGS-3400:4#config syslog host 1 udp_port 6000

Command: config syslog host 1 udp_port 6000

Success.

DGS-3400:4#config syslog host 1 ipaddress 10.44.67.8

Command: config syslog host 1 ipaddress 10.44.67.8

Success.

DGS-3400:4#config syslog host 1 state enabled

Command: config syslog host 1 state enabled

Success.

DGS-3400:4#

config syslog host all

Purpose	Used to configure the Syslog protocol to send system log data to a remote host.																		
Syntax	config syslog host all [severity [informational warning all] facility [local0 local1 local2 local3 local4 local5 local6 local7] udp_port <udp_port_number> state [enable disable]]																		
Description	The config syslog host all command is used to configure the syslog protocol to send system log information to a remote host.																		
Parameters	<i>all</i> – Specifies that the command will be applied to all hosts. <i>severity</i> – Severity level indicator, as described below: Bold font indicates that the corresponding severity level is currently supported on the Switch. <table> <thead> <tr> <th>Numerical Code</th><th>Severity</th></tr> </thead> <tbody> <tr> <td>0</td><td>Emergency: system is unusable</td></tr> <tr> <td>1</td><td>Alert: action must be taken immediately</td></tr> <tr> <td>2</td><td>Critical: critical conditions</td></tr> <tr> <td>3</td><td>Error: error conditions</td></tr> <tr> <td>4</td><td>Warning: warning conditions</td></tr> <tr> <td>5</td><td>Notice: normal but significant condition</td></tr> <tr> <td>6</td><td>Informational: informational messages</td></tr> <tr> <td>7</td><td>Debug: debug-level messages</td></tr> </tbody> </table> <i>informational</i> – Specifies that informational messages will be sent to the remote host. This corresponds to number 6 from the list above. <i>warning</i> – Specifies that warning messages will be sent to the remote host. This corresponds to number 4 from the list above. <i>all</i> – Specifies that all of the currently supported syslog messages that are generated by the Switch will be sent to the remote host. <i>facility</i> – Some of the operating system daemons and processes have been assigned Facility values. Processes and daemons that have not been explicitly assigned a Facility may use any of the "local use" facilities or they	Numerical Code	Severity	0	Emergency: system is unusable	1	Alert: action must be taken immediately	2	Critical: critical conditions	3	Error: error conditions	4	Warning: warning conditions	5	Notice: normal but significant condition	6	Informational: informational messages	7	Debug: debug-level messages
Numerical Code	Severity																		
0	Emergency: system is unusable

4	Warning: warning conditions																		
5	Notice: normal but significant condition																		
6	Informational: informational messages																		
7	Debug: debug-level messages																		

config syslog host all

may use the "user-level" Facility. Those Facilities that have been designated are shown in the following: **Bold** font indicates that the facility values the Switch currently supports.

Numerical Code	Facility
0	kernel messages
1	user-level messages
2	mail system
3	system daemons
4	security/authorization messages
5	messages generated internally by syslog
6	line printer subsystem
7	network news subsystem
8	UUCP subsystem
9	clock daemon
10	security/authorization messages
11	FTP daemon
12	NTP subsystem
13	log audit
14	log alert
15	clock daemon
16	local use 0 (local0)
17	local use 1 (local1)
18	local use 2 (local2)
19	local use 3 (local3)
20	local use 4 (local4)
21	local use 5 (local5)
22	local use 6 (local6)
23	local use 7 (local7)

local0 – Specifies that local use 0 messages will be sent to the remote host. This corresponds to number 16 from the list above.

local1 – Specifies that local use 1 messages will be sent to the remote host. This corresponds to number 17 from the list above.

local2 – Specifies that local use 2 messages will be sent to the remote host. This corresponds to number 18 from the list above.

local3 – Specifies that local use 3 messages will be sent to the remote host. This corresponds to number 19 from the list above.

local4 – Specifies that local use 4 messages will be sent to the remote host. This corresponds to number 20 from the list above.

local5 – Specifies that local use 5 messages will be sent to the remote host. This corresponds to number 21 from the list above.

local6 – Specifies that local use 6 messages will be sent to the remote host. This corresponds to number 22 from the list above.

local7 – Specifies that local use 7 messages will be sent to the remote host. This corresponds to number 23 from the list above.

udp_port <udp_port_number> – Specifies the UDP port number that the syslog protocol will use to send messages to the remote host.

state [enable | disable] – Allows the sending of syslog messages to the remote host, specified above, to be enabled and disabled.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure all Syslog hosts:

```

DGS-3400:4#config syslog host all severity all
Command: config syslog host all severity all

Success.
DGS-3400:4#config syslog host all facility local0
Command: config syslog host all facility local0

Success
DGS-3400:4#config syslog host all udp_port 6000
Command: config syslog host all udp_port 6000

Success.
DGS-3400:4#config syslog host all ipaddress 10.44.67.8
Command: config syslog host all ipaddress 10.44.67.8

Success.

DGS-3400:4#config syslog host all state enabled
Command: config syslog host all state enabled

Success.

DGS-3400:4#

```

delete syslog host

Purpose	Used to remove a Syslog host, that has been previously configured, from the Switch.
Syntax	delete syslog host [<index 1-4> all]
Description	The delete syslog host command is used to remove a Syslog host that has been previously configured from the Switch.
Parameters	<index 1-4> – Specifies that the command will be applied to an index of hosts. There are four available indexes, numbered 1 through 4. all – Specifies that the command will be applied to all hosts.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a previously configured Syslog host:

```

DGS-3400:4#delete syslog host 4
Command: delete syslog host 4

Success.

DGS-3400:4#

```

show syslog host

Purpose	Used to display the Syslog hosts currently configured on the Switch.
Syntax	show syslog host {<index 1-4>}
Description	The show syslog host command is used to display the Syslog hosts that are currently configured on the Switch.
Parameters	<index 1-4> – Specifies that the command will be applied to an index of hosts. There are four available indexes, numbered 1 through 4.

show syslog host

Restrictions	None.
--------------	-------

Example usage:

To show Syslog host information:

```
DGS-3400:4#show syslog host
Command: show syslog host

Syslog Global State: Disabled

Host Id  Host IP Address  Severity  Facility  UDP port  Status
-----  -
1        10.1.1.2          All       Local0    514       Disabled
2        10.40.2.3         All       Local0    514       Disabled
3        10.21.13.1        All       Local0    514       Disabled

Total Entries : 3

DGS-3400:4#
```

show syslog

Purpose	Used to display the global current running status of the Syslog function.
Syntax	show syslog
Description	The show syslog command will display the current running status of the Syslog function on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To show the global state of the Syslog function:

```
DGS-3400:4#show syslog
Command: show syslog

Syslog Global State: Disabled

DGS-3400:4#
```

config system_severity

Purpose	To configure severity level of an alert required for log entry or trap message.
Syntax	config system_severity [trap log all] [critical warning information]
Description	This command is used to configure the system severity levels on the Switch. When an event occurs on the Switch, a message will be sent to the SNMP agent (trap), the Switch's log or both. Events occurring on the Switch are separated into three main categories, these categories are NOT precisely the same as the parameters of the same name (see below). - Information – Events classified as information are basic events occurring on the Switch that are not deemed as problematic, such as enabling or disabling various functions on the Switch. - Warning - Events classified as warning are problematic events that are not critical to the overall function of the Switch but do require attention, such as unsuccessful

config system_severity

	downloads or uploads and failed logins.
	• Critical – Events classified as critical are fatal exceptions occurring on the Switch, such as hardware failures or spoofing attacks.
Parameters	Choose one of the following to identify where severity messages are to be sent. • trap – Entering this parameter will define which events occurring on the Switch will be sent to a SNMP agent for analysis. • log – Entering this parameter will define which events occurring on the Switch will be sent to the Switch's log for analysis. • all – Entering this parameter will define which events occurring on the Switch will be sent to a SNMP agent and the Switch's log for analysis. Choose one of the following to identify what level of severity warnings are to be sent to the destination entered above. critical – Entering this parameter along with the proper destination, stated above, will instruct the Switch to send only critical events to the Switch's log or SNMP agent. warning – Entering this parameter along with the proper destination, stated above, will instruct the Switch to send critical and warning events to the Switch's log or SNMP agent. information – Entering this parameter along with the proper destination, stated above, will instruct the switch to send informational, warning and critical events to the Switch's log or SNMP agent.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the system severity settings for critical traps only:

```
DGS-3400:4#config system_severity trap critical
Command: config system_severity trap critical

Success.

DGS-3400:4#
```

Example usage:

To upload an attack log file:

```
DGS-3400:4#upload attack_log_toTFTP 10.53.13.23 c:\attacklog1 unit 1
Command: upload attack_log_toTFTP 10.53.13.23 c:\attacklog1 unit 1

Connecting to server..... Done.
Upload attack log.....Done.

DGS-3400:4#
```

config log_save_timing

Purpose	Used to configure the method of saving log files to the switch's flash memory.
Syntax	config log_save_timing [time_interval <min 1-65535> on_demand log_trigger]
Description	The config log_save_timing command allows the user to configure the time method used in saving log files to the switch's flash memory.
Parameters	time_interval <min 1-65535> - Use this parameter to configure the time interval that will be implemented for saving log files. The log

config log_save_timing

	files will be save every x number of minutes that are configured here.
	<i>on_demand</i> - Users who choose this method will only save log files when they manually tell the Switch to do so, using the save or save log command.
	<i>log_trigger</i> - Users who choose this method will have log files saved to the Switch every time a log event occurs on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the time interval as every 30 minutes for saving log files:

```
DGS-3400:4#config log_save_timing time_interval 30
Command: config log_save_timing time_interval 30

Success.

DGS-3400:4#
```

show log_save_timing

Purpose	Used to display the method configured for saving log files to the switch's flash memory.
Syntax	show log_save_timing
Description	The show log_save_timing command allows the user to view the time method configured for saving log files to the switch's flash memory.
Parameters	None.
Restrictions	None.

Example usage:

To configure the time interval as every 30 minutes for saving log files:

```
DGS-3400:4#show log_save_timing
Command: show log_save_timing

Saving log method: every 30 minute(s)

DGS-3400:4#
```

MULTIPLE SPANNING TREE PROTOCOL (MSTP) COMMANDS

This Switch supports three versions of the Spanning Tree Protocol; 802.1d STP, 802.1w Rapid STP and 802.1s MSTP. Multiple Spanning Tree Protocol, or MSTP, is a standard defined by the IEEE community that allows multiple VLANs to be mapped to a single spanning tree instance, which will provide multiple pathways across the network. Therefore, these MSTP configurations will balance the traffic load, preventing wide scale disruptions when a single spanning tree instance fails. This will allow for faster convergences of new topologies for the failed instance. Frames designated for these VLANs will be processed quickly and completely throughout interconnected bridges utilizing either of the three spanning tree protocols (STP, RSTP or MSTP). This protocol will also tag BPDU packets so receiving devices can distinguish spanning tree instances, spanning tree regions and the VLANs associated with them. These instances will be classified by an *instance_id*. MSTP will connect multiple spanning trees with a Common and Internal Spanning Tree (CIST). The CIST will automatically determine each MSTP region, its maximum possible extent and will appear as one virtual bridge that runs a single spanning tree. Consequentially, frames assigned to different VLANs will follow different data routes within administratively established regions on the network, continuing to allow simple and full processing of frames, regardless of administrative errors in defining VLANs and their respective spanning trees. Each switch utilizing the MSTP on a network will have a single MSTP configuration that will have the following three attributes:

- A configuration name defined by an alphanumeric string of up to 32 characters (defined in the **config stp mst_config_id** command as *name <string>*).
- A configuration revision number (named here as a *revision_level*) and;
- A 4096 element table (defined here as a *vid_range*) which will associate each of the possible 4096 VLANs supported by the Switch for a given instance.

To utilize the MSTP function on the Switch, three steps need to be taken:

- The Switch must be set to the MSTP setting (**config stp version**)
- The correct spanning tree priority for the MSTP instance must be entered (**config stp priority**).
- VLANs that will be shared must be added to the MSTP Instance ID (**config stp instance_id**).

The Multiple Spanning Tree Protocol commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable stp	
disable stp	
config stp version	[mstp rstp stp]
config stp	{maxage <value 6-40> maxhops <value 1-20> hellotime <value 1-10> forwarddelay <value 4-30> txholdcount <value 1-10> fbpd [enable disable] lbd [enable disable] lbd_recover_timer [<value 0> <value 60 -1000000>]}
config stp ports	<portlist> {externalCost [auto <value 1-200000000>] hellotime <value 1-10> migrate [yes no] edge [true false] p2p [true false auto] state [enable disable] lbd [enable disable] fbpd [enable disable]}
create stp instance_id	<value 1-15>
config stp instance_id	<value 1-15> [add_vlan remove_vlan] <vidlist>
delete stp instance_id	<value 1-15>
config stp priority	<value 0-61440> instance_id <value 0-15>
config stp mst_config_id	{revision_level <int 0-65535> name <string>}
config stp mst_ports	<portlist> instance_id <value 0-15> {internalCost [auto value 1-200000000] priority <value 0-240>}
show stp	
show stp ports	{<portlist>}
show stp instance	{<value 0-15>}
show stp mst_config id	

Each command is listed, in detail, in the following sections.

enable stp

Purpose	Used to globally enable STP on the Switch.
Syntax	enable stp
Description	This command allows the Spanning Tree Protocol to be globally enabled on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable STP, globally, on the Switch:

```
DGS-3400:4#enable stp
Command: enable stp

Success.

DGS-3400:4#
```

disable stp

Purpose	Used to globally disable STP on the Switch.
Syntax	disable stp
Description	This command allows the Spanning Tree Protocol to be globally disabled on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable STP on the Switch:

```
DGS-3400:4#disable stp
Command: disable stp

Success.

DGS-3400:4#
```

config stp version

Purpose	Used to globally set the version of STP on the Switch.
Syntax	config stp version [mstp rstp stp]
Description	This command allows the user to choose the version of the spanning tree to be implemented on the Switch.
Parameters	<i>mstp</i> – Selecting this parameter will set the Multiple Spanning Tree Protocol (MSTP) globally on the Switch. <i>rstp</i> - Selecting this parameter will set the Rapid Spanning Tree Protocol (RSTP) globally on the Switch. <i>stp</i> - Selecting this parameter will set the Spanning Tree Protocol (STP) globally on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To set the Switch globally for the Multiple Spanning Tree Protocol (MSTP):

```
DGS-3400:4#config stp version mstp
```

```
Command: config stp version mstp
```

```
Success.
```

```
DGS-3400:4#
```

config stp

Purpose	Used to setup STP, RSTP and MSTP on the Switch.
Syntax	config stp {maxage <value 6-40> maxhops <value 1-20> hellotime <1-10> forwarddelay <value 4-30> txholdcount <value 1-10> fbpdu [enable disable] lbd [enable disable] lbd_recover_timer [<value 0> <value 60 -1000000>]}
Description	This command is used to setup the Spanning Tree Protocol (STP) for the entire switch. All commands here will be implemented for the STP version that is currently set on the Switch.
Parameters	<i>maxage</i> <value 6-40> – This value may be set to ensure that old information does not endlessly circulate through redundant paths in the network, preventing the effective propagation of the new information. Set by the Root Bridge, this value will aid in determining that the Switch has spanning tree configuration values consistent with other devices on the bridged LAN. If the value ages out and a BPDU has still not been received from the Root Bridge, the Switch will start sending its own BPDU to all other switches for permission to become the Root Bridge. If it turns out that your switch has the lowest Bridge Identifier, it will become the Root Bridge. The user may choose a time between 6 and 40 seconds. The default value is 20. <i>maxhops</i> <value 1-20> - The number of hops between devices in a spanning tree region before the BPDU (bridge protocol data unit) packet sent by the Switch will be discarded. Each switch on the hop count will reduce the hop count by one until the value reaches zero. The Switch will then discard the BPDU packet and the information held for the port will age out. The user may set a hop count from 1 to 20. The default is 20. <i>hellotime</i> <value 1-10> – The user may set the time interval between transmission of configuration messages by the root device in STP, or by the designated router in RSTP, thus stating that the Switch is still functioning. A time between 1 and 10 seconds may be chosen, with a default setting of 2 seconds. In MSTP, the spanning tree is configured by port and therefore, the <i>hellotime</i> must be set using the configure stp ports command for switches utilizing the Multiple Spanning Tree Protocol. <i>forwarddelay</i> <value 4-30> – The maximum amount of time (in seconds) that the root device will wait before changing states. The user may choose a time between 4 and 30 seconds. The default is 15 seconds. <i>txholdcount</i> <value 1-10> - The maximum number of BPDU Hello packets transmitted per interval. Default value = 3. <i>fbpdu</i> [enable disable] – Allows the forwarding of STP BPDU packets from other network devices when STP is disabled on the Switch. The default is <i>enable</i>. <i>lbd</i> [enable disable] – When this is enabled, the Switch will temporarily block STP switch-wide when a BPDU packet has been looped back. If the Switch detects its own BPDU packet coming back, it signifies a loop on the network. STP will automatically be blocked and an alert will be sent to the administrator. The default is <i>enable</i>. <i>lbd_recover_timer</i> [0 < second 60 -1000000 >] – Time allowed for recovery after an STP loopback has been detected. After the timer has expired the Switch checks for an STP loopback, if no loopback detected, STP will be resumed. Entering 0 will disable LBD recovery.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure STP with maxage 18 and maxhops of 15:

```
DGS-3400:4#config stp maxage 18 maxhops 15
```

```
Command: config stp maxage 18 maxhops 15
```

```
Success.
```

```
DGS-3400:4#
```

config stp ports

Purpose	Used to setup STP on the port level.
Syntax	config stp ports <portlist> {externalCost [auto <value 1-200000000>] hellotime <value 1-10> migrate [yes no] edge [true false] p2p [true false auto] state [enable disable] lbd [enable disable] fbpdpu [enable disable]}
Description	This command is used to create and configure STP for a group of ports.
Parameters	<portlist> – Specifies a range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) externalCost – This defines a metric that indicates the relative cost of forwarding packets to the specified port list. Port cost can be set automatically or as a metric value. The default value is <i>auto</i>. <i>auto</i> – Setting this parameter for the external cost will automatically set the speed for forwarding packets to the specified port(s) in the list for optimal efficiency. Default port cost: 100Mbps port = 200000. Gigabit port = 20000. <value 1-200000000> - Define a value between 1 and 200000000 to determine the external cost. The lower the number, the greater the probability the port will be chosen to forward packets. hellotime <value 1-10> – The time interval between transmission of configuration messages by the designated port, to other devices on the bridged LAN, thus stating that the Switch is still functioning. The user may choose a time between 1 and 10 seconds. The default is 2 seconds. migrate [yes no] – Setting this parameter as “yes” will set the ports to send out BPDU packets to other bridges, requesting information on their STP setting. If the Switch is configured for RSTP, the port will be capable to migrate from 802.1d STP to 802.1w RSTP. If the Switch is configured for MSTP, the port is capable of migrating from 802.1d STP to 802.1s MSTP. RSTP and MSTP can coexist with standard STP, however the benefits of RSTP and MSTP are not realized on a port where an 802.1d network connects to an 802.1w or 802.1s enabled network. Migration should be set as yes on ports connected to network stations or segments that are capable of being upgraded to 802.1w RSTP or 802.1s MSTP on all or some portion of the segment. edge [true false] – <i>true</i> designates the port as an edge port. Edge ports cannot create loops, however an edge port can lose edge port status if a topology change creates a potential for a loop. An edge port normally should not receive BPDU packets. If a BPDU packet is received it automatically loses edge port status. <i>false</i> indicates that the port does not have edge port status. p2p [true false auto] – <i>true</i> indicates a point-to-point (P2P) shared link. P2P

config stp ports

ports are similar to edge ports however they are restricted in that a P2P port must operate in full-duplex. Like edge ports, P2P ports transition to a forwarding state rapidly thus benefiting from RSTP. A p2p value of false indicates that the port cannot have p2p status. *auto* allows the port to have p2p status whenever possible and operate as if the p2p status were *true*. If the port cannot maintain this status (for example if the port is forced to half-duplex operation) the p2p status changes to operate as if the p2p value were *false*. The default setting for this parameter is *auto*.

state [enable | disable] – Allows STP to be enabled or disabled for the ports specified in the port list. The default is *enable*.

lbd [enable | disable] – When this is enabled, the Switch will temporarily block STP on the port when a BPDU packet has been looped back. If the Switch detects its own BPDU packet coming back, it signifies a loop on the network. STP will automatically be blocked and an alert will be sent to the administrator. The default is *disable*.

fbpdu [enable | disable] – Enabling this parameter will allow the forwarding of STP BPDU from other network devices when STP is disabled on the port. The default is *enable*.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure STP with path cost 19, hellotime set to 5 seconds, migration enable, and state enable for ports 1-5 of module 1.

DGS-3400:4#config stp ports 1:1-1:5 externalCost 19 hellotime 5 migrate yes state enable

Command: config stp ports 1:1-1:5 externalCost 19 hellotime 5 migrate yes state enable

Success.

DGS-3400:4#

create stp instance_id

Purpose Used to create a STP instance ID for MSTP.

Syntax **create stp instance_id <value 1-15>**

Description This command allows the user to create a STP instance ID for the Multiple Spanning Tree Protocol. There are 16 STP instances on the Switch (one internal CIST, unchangeable) and the user may create up to 15 instance IDs for the Switch.

Parameters **<value 1-15>** - Enter a value between 1 and 15 to identify the Spanning Tree instance on the Switch.

Restrictions Only administrator-level users can issue this command.

Example usage:

To create a spanning tree instance 2:

DGS-3400:4#create stp instance_id 2

Command: create stp instance_id 2

Success.

DGS-3400:4#

config stp instance_id

Purpose	Used to add or delete an STP instance ID.
Syntax	config stp instance_id <value 1-15> [add_vlan remove_vlan] <vidlist>
Description	This command is used to map VIDs (VLAN IDs) to previously configured STP instances on the Switch by creating an <i>instance_id</i>. A STP instance may have multiple members with the same MSTP configuration. There is no limit to the number of STP regions in a network but each region only supports a maximum of 16 spanning tree instances (one unchangeable default entry). VIDs can belong to only one spanning tree instance at a time. Note that switches in the same spanning tree region having the same STP <i>instance_id</i> must be mapped identically, and have the same configuration <i>revision_level</i> number and the same <i>name</i>.
Parameters	<value 1-15> - Enter a number between 1 and 15 to define the instance_id. The Switch supports 16 STP regions with one unchangeable default instance ID set as 0. add_vlan – Along with the vid_range <vidlist> parameter, this command will add VIDs to the previously configured STP instance_id. remove_vlan – Along with the vid_range <vidlist> parameter, this command will remove VIDs to the previously configured STP instance_id. <vidlist> – Specify the VID range from configured VLANs set on the Switch. Supported VIDs on the Switch range from ID number 1 to 4094.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure instance ID 2 to add VID 10:

```
DGS-3400:4#config stp instance_id 2 add_vlan 10
Command : config stp instance_id 2 add_vlan 10

Success.

DGS-3400:4#
```

Example usage:

To remove VID 10 from instance ID 2:

```
DGS-3400:4#config stp instance_id 2 remove_vlan 10
Command : config stp instance_id 2 remove_vlan 10

Success.

DGS-3400:4#
```

delete stp instance_id

Purpose	Used to delete a STP instance ID from the Switch.
Syntax	delete stp instance_id <value 1-15>
Description	This command allows the user to delete a previously configured STP instance ID from the Switch.
Parameters	<value 1-15> - Enter a value between 1 and 15 to identify the Spanning Tree instance on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete STP instance ID 2 from the Switch.

```
DGS-3400:4#delete stp instance_id 2
Command: delete stp instance_id 2

Success.

DGS-3400:4#
```

config stp priority

Purpose	Used to update the STP instance configuration
Syntax	config stp priority <value 0-61440> instance_id <value 0-15>
Description	This command is used to update the STP instance configuration settings on the Switch. The MSTP will utilize the priority in selecting the root bridge, root port and designated port. Assigning higher priorities to STP regions will instruct the Switch to give precedence to the selected <i>instance_id</i> for forwarding packets. The lower the priority value set, the higher the priority.
Parameters	<i>priority <value 0-61440></i> - Select a value between 0 and 61440 to specify the priority for a specified instance id for forwarding packets. The lower the value, the higher the priority. This entry must be divisible by 4096. <i>instance_id <value 0-15></i> - Enter the value corresponding to the previously configured instance id of which the user wishes to set the priority value. An instance id of 0 denotes the default <i>instance_id</i> (CIST) internally set on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To set the priority value for *instance_id* 2 as 4096:

```
DGS-3400:4#config stp priority 4096 instance_id 2
Command : config stp priority 4096 instance_id 2

Success.

DGS-3400:4#
```

config stp mst_config_id

Purpose	Used to update the MSTP configuration identification.
Syntax	config stp mst_config_id {revision_level <int 0-65535> name <string>}
Description	This command will uniquely identify the MSTP configuration currently configured on the Switch. Information entered here will be attached to BPDU packets as an identifier for the MSTP region to which it belongs. Switches having the same <i>revision_level</i> and <i>name</i> will be considered as part of the same MSTP region.
Parameters	<i>revision_level <int 0-65535></i>— Enter a number between 0 and 65535 to identify the MSTP region. This value, along with the name will identify the MSTP region configured on the Switch. The default setting is 0. <i>name <string></i> - Enter an alphanumeric string of up to 32 characters to uniquely identify the MSTP region on the Switch. This <i>name</i>, along with the <i>revision_level</i> value will identify the MSTP region configured on the Switch. If no <i>name</i> is entered, the default name will be the MAC address of the device.

config stp mst_config_id

Restrictions	Only administrator-level users can issue this command.
--------------	--

Example usage:

To configure the MSTP region of the Switch with *revision_level* 10 and the *name* “Trinity”:

```
DGS-3400:4#config stp mst_config_id revision_level 10 name Trinity
Command : config stp mst_config_id revision_level 10 name Trinity

Success.

DGS-3400:4#
```

config stp mst_ports

Purpose	Used to update the port configuration for a MSTP instance.
Syntax	config stp mst_ports <portlist> instance_id <value 0-15> {internalCost [auto <value 1-200000000>] priority <value 0-240>}
Description	This command will update the port configuration for a STP <i>instance_id</i> . If a loop occurs, the MSTP function will use the port priority to select an interface to put into the forwarding state. Set a higher priority value for interfaces to be selected for forwarding first. In instances where the priority value is identical, the MSTP function will implement the lowest port number into the forwarding state and other interfaces will be blocked. Remember that lower priority values mean higher priorities for forwarding packets.
Parameters	<portlist> - Specifies a range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) instance_id <value 0-15> - Enter a numerical value between 0 and 15 to identify the <i>instance_id</i> previously configured on the Switch. An entry of 0 will denote the CIST (Common and Internal Spanning Tree). internalCost – This parameter is set to represent the relative cost of forwarding packets to specified ports when an interface is selected within a STP instance. The default setting is <i>auto</i>. There are two options: <i>auto</i> – Selecting this parameter for the <i>internalCost</i> will set quickest route automatically and optimally for an interface. The default value is derived from the media speed of the interface. <i>value 1-2000000</i> – Selecting this parameter with a value in the range of 1-2000000 will set the quickest route when a loop occurs. A lower <i>internalCost</i> represents a quicker transmission. priority <value 0-240> - Enter a value between 0 and 240 to set the priority for the port interface. A higher priority will designate the interface to forward packets first. A lower number denotes a higher priority.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To designate ports 1 to 2 on module 1, with instance ID 0, to have an auto internalCost and a priority of 0:

```
DGS-3400:4#config stp mst_ports 1:1-1:2 instance_id 0 internalCost auto priority 0
Command: config stp mst_ports 1:1-1:2 instance_id 0 internalCost auto priority 0

Success.

DGS-3400:4#
```

show stp

Purpose	Used to display the Switch's current STP configuration.
Syntax	show stp
Description	This command displays the Switch's current STP configuration.
Parameters	None.
Restrictions	None.

Example usage:

To display the status of STP on the Switch:

Status 1: STP enabled with STP compatible version

```
DGS-3400:4#show stp
Command: show stp

STP Bridge Global Settings
-----
STP Status           : Enabled
STP Version          : STP Compatible

show stp ports

Purpose	Used to display the Switch's current STP port configuration.
Syntax	show stp ports <portlist>
Description	This command displays the STP port settings and STP port Operational Status currently implemented on the Switch.
Parameters	<portlist> – Specifies a range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None

Example usage:

To show STP ports:

```
DGS-3400:4#show stp ports 1:1-1:9
```

```
Command: show stp ports 1:1-1:9
```

MSTP Port Information

```
-----
Port Index   : 1:1   , Hello Time: 2 /2 , Port STP Enabled , LBD : No

show stp instance

Purpose	Used to display the Switch's STP instance configuration
Syntax	show stp instance <value 0-15>
Description	This command displays the Switch's current STP Instance Settings and the STP Instance Operational Status.
Parameters	<value 0-15> - Enter a value defining the previously configured <i>instance_id</i> on the Switch. An entry of 0 will display the STP configuration for the CIST internally set on the Switch.
Restrictions	None.

Example usage:

To display the STP instance configuration for instance 0 (the internal CIST) on the Switch:

```
DGS-3400:4#show stp instance 0
Command: show stp instance 0

STP Instance Settings
-----
Instance Type           : CIST

FORWARDING DATABASE COMMANDS

The layer 2 forwarding database commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create fdb	<vlan_name 32> <macaddr> port <port>
create multicast_fdb	<vlan_name 32> <macaddr>
config multicast_fdb	<vlan_name 32> <macaddr> [add delete] <portlist>
config fdb aging_time	<sec 10-1000000>
delete fdb	<vlan_name 32> <macaddr>
clear fdb	[vlan <vlan_name 32> port <port> all]
show multicast_fdb	{vlan <vlan_name 32> mac_address <macaddr>}
show fdb	{port <port> vlan <vlan_name 32> mac_address <macaddr> static aging_time}
config multicast filtering_mode	[<vlan_name 32> all] [forward_all_groups forward_unregistered_groups filter_unregistered_groups]
show multicast filtering_mode	{vlan <vlan_name 32>}
show ipfdb	

Each command is listed, in detail, in the following sections.

create fdb

Purpose	Used to create a static entry to the unicast MAC address forwarding table (database).
Syntax	create fdb <vlan_name 32> <macaddr> port <port>
Description	This command will make an entry into the Switch's unicast MAC address forwarding database.
Parameters	<vlan_name 32> – The name of the VLAN on which the MAC address resides. <macaddr> – The MAC address that will be added to the forwarding table. port <port> – The port number corresponding to the MAC destination address. The Switch will always forward traffic to the specified device through this port. The port is specified by listing the switch number and the port number on that switch, separated by a colon. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create a unicast MAC FDB entry:

```
DGS-3400:4#create fdb default 00-00-00-00-01-02 port 1:5
Command: create fdb default 00-00-00-00-01-02 port 1:5

Success.

DGS-3400:4#
```

create multicast_fdb

Purpose	Used to create a static entry to the multicast MAC address forwarding table (database)
Syntax	create multicast_fdb <vlan_name 32> <macaddr>
Description	This command will make an entry into the Switch's multicast MAC address forwarding database.
Parameters	<vlan_name 32> – The name of the VLAN on which the MAC address resides. <macaddr> – The MAC address that will be added to the forwarding table.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create multicast MAC forwarding:

```
DGS-3400:4#create multicast_fdb default 01-00-00-00-00-01
Command: create multicast_fdb default 01-00-00-00-00-01

Success.

DGS-3400:4#
```

config multicast_fdb

Purpose	Used to configure the Switch's multicast MAC address forwarding database.
Syntax	config multicast_fdb <vlan_name 32> <macaddr> [add delete] <portlist>
Description	This command configures the multicast MAC address forwarding table.
Parameters	<vlan_name 32> – The name of the VLAN on which the MAC address resides. <macaddr> – The MAC address that will be added to the multicast forwarding table. [add delete] – <i>add</i> will add ports to the forwarding table. <i>delete</i> will remove ports from the multicast forwarding table. <portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To add multicast MAC forwarding:

```
DGS-3400:4#config multicast_fdb default 01-00-00-00-00-01 add 1:1-1:5
Command: config multicast_fdb default 01-00-00-00-00-01 add 1:1-1:5

Success.

DGS-3400:4#
```

config fdb aging_time

Purpose	Used to set the aging time of the forwarding database.
Syntax	config fdb aging_time <sec 10-1000000>
Description	The aging time affects the learning process of the Switch. Dynamic forwarding table entries, which are made up of the source MAC addresses and their associated port numbers, are deleted from the table if they are not accessed within the aging time. The aging time can be from 10 to 1000000 seconds with a default value of 300 seconds. A very long aging time can result in dynamic forwarding table entries that are out-of-date or no longer exist. This may cause incorrect packet forwarding decisions by the Switch. If the aging time is too short however, many entries may be aged out too soon. This will result in a high percentage of received packets whose source addresses cannot be found in the forwarding table, in which case the Switch will broadcast the packet to all ports, negating many of the benefits of having a switch.
Parameters	<sec 10-1000000> – The aging time for the MAC address forwarding database value. The value in seconds may be between 10 and 1000000 seconds.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To set the FDB aging time:

```
DGS-3400:4#config fdb aging_time 300
Command: config fdb aging_time 300

Success.

DGS-3400:4#
```

delete fdb

Purpose	Used to delete an entry to the Switch's forwarding database.
Syntax	delete fdb <vlan_name 32> <macaddr>
Description	This command is used to delete a previous entry to the Switch's MAC address forwarding database.
Parameters	<vlan_name 32> – The name of the VLAN on which the MAC address resides. <macaddr> – The MAC address that will be added to the forwarding table.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a permanent FDB entry:

```
DGS-3400:4#delete fdb default 00-00-00-00-01-02
Command: delete fdb default 00-00-00-00-01-02

Success.

DGS-3400:4#
```

Example usage:

To delete a multicast FDB entry:

```
DGS-3400:4#delete fdb default 01-00-00-00-01-02
Command: delete fdb default 01-00-00-00-01-02

Success.

DGS-3400:4#
```

clear fdb

Purpose	Used to clear the Switch's forwarding database of all dynamically learned MAC addresses.
Syntax	clear fdb [vlan <vlan_name 32> port <port> all]
Description	This command is used to clear dynamically learned entries to the Switch's forwarding database.
Parameters	<vlan_name 32> – The name of the VLAN on which the MAC address resides. port <port> – The port number corresponding to the MAC destination address. The Switch will always forward traffic to the specified device through this port. The port is specified by listing the switch number and the port number on that switch, separated by a colon. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Clears all dynamic entries to the Switch's forwarding database.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To clear all FDB dynamic entries:

```
DGS-3400:4#clear fdb all
Command: clear fdb all

Success.

DGS-3400:4#
```

show multicast_fdb

Purpose	Used to display the contents of the Switch's multicast forwarding database.
Syntax	show mulitcast_fdb [vlan <vlan_name 32> mac_address <macaddr>]
Description	This command is used to display the current contents of the Switch's multicast MAC address forwarding database.
Parameters	<vlan_name 32> – The name of the VLAN on which the MAC address resides. <macaddr> – The MAC address that is present in the forwarding database table.
Restrictions	None.

Example usage:

To display multicast MAC address table:

```
DGS-3400:4#show multicast_fdb vlan default
Command: show multicast_fdb vlan default
```

```
VLAN Name      : default
MAC Address    : 01-00-5E-00-00-00
Egress Ports   : 1:1-1:5
Mode           : Static
```

```
Total Entries  : 1
```

```
DGS-3400:4#
```

show fdb

Purpose	Used to display the current unicast MAC address forwarding database.
Syntax	show fdb {port <port> vlan <vlan_name 32> mac_address <macaddr> static aging_time}
Description	This command will display the current contents of the Switch's forwarding database.
Parameters	<i>port <port></i> – The port number corresponding to the MAC destination address. The Switch will always forward traffic to the specified device through this port. The port is specified by listing the switch number and the port number on that switch, separated by a colon. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. <vlan_name 32> – The name of the VLAN on which the MAC address resides. <macaddr> – The MAC address that is present in the forwarding database table. <i>static</i> – Displays the static MAC address entries. <i>aging_time</i> – Displays the aging time for the MAC address forwarding database.
Restrictions	None.

Example usage:

To display unicast MAC address table:

DGS-3400:4#show fdb**Command: show fdb****Unicast MAC Address Aging Time = 300**

CTRL+C ESC q Quit SPACE n Next Page ENTER Next Entry a All

config multicast filtering_mode

Purpose	Used to configure the multicast packet filtering mode for specific VLANs .
Syntax	config multicast filtering_mode [<vlan_name 32> all] [forward_all_groups forward_unregistered_groups filter_unregistered_groups]
Description	This command will configure the multicast packet filtering mode for specified VLANs on the Switch.
Parameters	<vlan_name 32> - Specifies a VLAN by VLAN name to set. If no VLAN is defined here, the rule is applied to all VLANs [forward_all_groups forward_unregistered_groups filter_unregistered_groups] – The user may set the filtering mode to any of these three options.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the multicast filtering mode to filter unregistered groups on all VLANs.

DGS-3400:4#config multicast filtering_mode all filter_unregistered_groups**Command: config multicast filtering_mode all filter_unregistered_groups****Success.****DGS-3400:4#**

show multicast filtering_mode

Purpose	Used to show the multicast packet filtering mode as configured for the VLANs.
Syntax	show multicast filtering_mode {vlan <vlan_name 32>}
Description	This command will display the current multicast packet filtering mode for specified VLANs or all VLANs on the Switch.
Parameters	<i>vlan <vlan_name 32></i> - Specifies a VLAN to display multicast filtering status.
Restrictions	None.

Example usage:

To view the multicast filtering mode for all VLANs:

```
DGS-3400:4#show multicast filtering_mode
Command: show multicast filtering_mode

VLAN Name           Multicast Filter Mode
-----
default             filter_unregistered_groups
v1                  filter_unregistered_groups
v2                  filter_unregistered_groups
v3                  filter_unregistered_groups

DGS-3400:4#
```

show ipfdb

Purpose	Used to display the current IP address forwarding database table.
Syntax	show ipfdb <ipaddr>
Description	This command will display the current contents of the Switch's IP forwarding database.
Parameters	<i><ipaddr></i> - The user may enter an IP address by which to view the table.
Restrictions	None.

Example usage:

To view the IP forwarding database table:

DGS-3400:4#show ipfdb

Command: show ipfdb

TRAFFIC CONTROL COMMANDS

On a computer network, packets such as Multicast packets and Broadcast packets continually flood the network as normal procedure. At times, this traffic may increase do to a malicious endstation on the network or a malfunctioning device, such as a faulty network card. Thus, switch throughput problems will arise and consequently affect the overall performance of the switch network. To help rectify this packet storm, the Switch will monitor and control the situation.

The packet storm is monitored to determine if too many packets are flooding the network, based on the threshold level provided by the user. Once a packet storm has been detected, the Switch will drop packets coming into the Switch until the storm has subsided. This method can be utilized by selecting the **Drop** option of the **Action** field in the window below. The Switch will also scan and monitor packets coming into the Switch by monitoring the Switch's chip counter. This method is only viable for Broadcast and Multicast storms because the chip only has counters for these two types of packets. Once a storm has been detected (that is, once the packet threshold set below has been exceeded), the Switch will shutdown the port to all incoming traffic with the exception of STP BPDU packets, for a time period specified using the Countdown field. If this field times out and the packet storm continues, the port will be placed in a Shutdown Forever mode which will produce a warning message to be sent to the Trap Receiver. Once in Shutdown Forever mode, the only method of recovering this port is to manually recoup it using the **Port Configuration** window in the **Administration** folder and selecting the disabled port and returning it to an Enabled status. To utilize this method of Storm Control, choose the **Shutdown** option of the **Action** field in the window below.

The broadcast storm control commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config traffic control	[<portlist> all] {broadcast [enable disable] multicast [enable disable] dlf [enable disable] action [drop shutdown] threshold <value 0-255000> countdown [<value 0> <value 5-30>] time_interval <value 5-30>}
config traffic control_recover	[<portlist> all]
config traffic trap	[none storm_occurred storm_cleared both]
show traffic control	{<portlist>}

Each command is listed, in detail, in the following sections.

config traffic control

Purpose	Used to configure broadcast/multicast traffic control.
Syntax	config traffic control [<portlist> all] broadcast [enable disable] multicast [enable disable] dlf [enable disable] action [drop shutdown] threshold <value 0-255000> countdown [<value 0> <value 5-30>] time_interval <value 5-30>}
Description	This command is used to configure traffic control.
Parameters	<portlist> – Used to specify a range of ports to be configured for traffic control. This is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specifies all ports are to be configured for traffic control on the Switch. broadcast [enable disable] – Enables or disables broadcast storm control. multicast [enable disable] – Enables or disables multicast storm control. dlf [enable disable] – Enables or disables dlf traffic control. action – Used to configure the action taken when a storm control has been

config traffic control

detected on the Switch. The user has two options:

- *drop* - Utilizes the hardware Traffic Control mechanism, which means the Switch's hardware will determine the Packet Storm based on the Threshold value stated and drop packets until the issue is resolved.
- *shutdown* - Utilizes the Switch's software Traffic Control mechanism to determine the Packet Storm occurring. Once detected, the port will deny all incoming traffic to the port except STP BPDU packets, which are essential in keeping the Spanning Tree operational on the Switch. If the countdown timer has expired and yet the Packet Storm continues, the port will be placed in Shutdown Forever mode and is no longer operational until the user manually resets the port using the **config traffic control_recover** command. Choosing this option obligates the user to configure the *time_interval* field as well, which will provide packet count samplings from the Switch's chip to determine if a Packet Storm is occurring.

threshold <value 0-255000> – The upper threshold at which the specified traffic control is switched on. The *<value>* is the number of broadcast/multicast/dlf packets, in packets per second (pps), received by the Switch that will trigger the storm traffic control measures. The default setting is 131072.

time_interval - The Interval will set the time between Multicast and Broadcast packet counts sent from the Switch's chip to the Traffic Control function. These packet counts are the determining factor in deciding when incoming packets exceed the Threshold value.

- *sec 5-30* - The Interval may be set between 5 and 30 seconds with the default setting of 5 seconds.

countdown - The countdown timer is set to determine the amount of time, in minutes, that the Switch will wait before shutting down the port that is experiencing a traffic storm. This parameter is only useful for ports configured as **shutdown** in the **action** field of this command and therefore will not operate for Hardware based Traffic Control implementations.

- *0* - 0 is the default setting for this field and 0 will denote that the port will never shutdown.
- *minutes 5-30* – Select a time from 5 to 30 minutes that the Switch will wait before shutting down. Once this time expires and the port is still experiencing packet storms, the port will be placed in shutdown forever mode and can only be manually recovered using the **config traffic control_recover** command mentioned previously in this manual.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure traffic control and enable broadcast storm control system wide:

```
DGS-3400:4#config traffic control all broadcast enable
Command: config traffic control all broadcast enable
```

```
Success.
```

```
DGS-3400:4#
```

config traffic control_recover

Purpose	Used to configure traffic control recover for any or all ports.
Syntax	config traffic control_recover [<portlist> all]
Description	Configuring a port for traffic control recover will require an administrator to restart the specified ports if storm control shuts down the port or ports. That is, if a storm triggers the action <i>shutdown</i> for a port, it will remain in the shutdown even if the threshold falls below the value that triggers the storm control action.
Parameters	<portlist> - Used to specify a range of ports. This is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – All ports on switches in the switch stack.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure traffic control recover for ports 1-6 on unit 1:

```
DGS-3400:4#config traffic control_recover 1:1-1:6
Command: config traffic control_recover 1:1-1:6

Success.

DGS-3400:4#
```

config traffic trap

Purpose	Used to configure traps for traffic control.
Syntax	config traffic trap [none storm_occurred storm_cleared both]
Description	Use this to enable traffic storm trap messages.
Parameters	none – Will send no Storm trap warning messages regardless of action taken by the Traffic Control mechanism. storm_occurred – Will send Storm Trap warning messages upon the occurrence of a Traffic Storm only. storm_cleared – Will send Storm Trap messages when a Traffic Storm has been cleared by the Switch only. both – Will send Storm Trap messages when a Traffic Storm has been both detected and cleared by the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure traffic control and enable broadcast storm control system wide:

```
DGS-3400:4#config traffic trap storm_occurred
Command: config traffic trap storm_occurred

Success.

DGS-3427:4#
```

show traffic control

Purpose	Used to display current traffic control settings.
Syntax	show traffic control {<portlist>}
Description	This command displays the current storm traffic control configuration on the Switch.
Parameters	<portlist> - Specify a range of ports to display. If unspecified, all ports will be displayed. This is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None.

Example usage:

To display traffic control setting:

DGS-3400:4#show traffic control								
Command: show traffic control								
Traffic Storm Control Trap :[None]								
Port	Thres hold	Broadcast Storm	Multicast Storm	DLF Storm	Action	Count down	Time Interval	Shutdown Forever

QoS COMMANDS

The xStack DGS-3400 Series supports 802.1p priority queuing. The Switch has 8 priority queues, one of which is internal and not configurable. These priority queues are numbered from 6 (Class 6) — the highest priority queue — to 0 (Class 0) — the lowest priority queue. The eight priority tags specified in IEEE 802.1p (p0 to p7) are mapped to the Switch's priority queues as follows:

- Priority 0 is assigned to the Switch's Q2 queue.
- Priority 1 is assigned to the Switch's Q0 queue.
- Priority 2 is assigned to the Switch's Q1 queue.
- Priority 3 is assigned to the Switch's Q3 queue.
- Priority 4 is assigned to the Switch's Q4 queue.
- Priority 5 is assigned to the Switch's Q5 queue.
- Priority 6 is assigned to the Switch's Q6 queue.
- Priority 7 is assigned to the Switch's Q6 queue.

Priority scheduling is implemented by the priority queues stated above. The Switch will empty the seven hardware priority queues in order, beginning with the highest priority queue, 6, to the lowest priority queue, 0. Each hardware queue will transmit all of the packets in its buffer before permitting the next lower priority to transmit its packets. When the lowest hardware priority queue has finished transmitting all of its packets, the highest hardware priority queue will begin transmitting any packets it may have received.

The commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config bandwidth_control	[<portlist> all] {rx_rate [no_limit <value 1-156249>] tx_rate [no_limit <value 1-156249>]}
show bandwidth_control	{<portlist>}
config scheduling	<class_id 0-6> {max_packet <value 0-15>}
show scheduling	
config 802.1p user_priority	<priority 0-7> <class_id 0-6>
show 802.1p user_priority	
config 802.1p default_priority	[<portlist> all] <priority 0-7>
show 802.1p default_priority	{<portlist>}
config scheduling_mechanism	[strict weight_fair]
show scheduling_mechanism	
enable hol_prevention	
disable hol_prevention	
show hol_prevention	

Each command is listed, in detail, in the following sections.

config bandwidth_control

Purpose	Used to configure bandwidth control on a port-by-port basis.
Syntax	config bandwidth_control <portlist> {rx_rate [no_limit <value 1-156249>] tx_rate [no_limit <value 1-156249>]}
Description	The config bandwidth_control command is used to configure bandwidth on a port-by-port basis.
Parameters	<portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) rx_rate – Specifies that one of the parameters below (no_limit or <value 1-156249>) will be applied to the rate at which the above specified ports will be allowed to receive packets - no_limit – Specifies that there will be no limit on the rate of packets received by the above specified ports. <value 1-156249> – Specifies the receiving packet limit, where each value entered here represents 64Kbps. (ex. A value of 2 would be 128kbps) tx_rate – Specifies that one of the parameters below (no_limit or <value 1-156249>) will be applied to the rate at which the above specified ports will be allowed to transmit packets. - no_limit – Specifies that there will be no limit on the rate of packets transmitted by the above specified ports. <value 1-156249> – Specifies the transferring packet limit, where each value entered here represents 64Kbps. (ex. A value of 2 would be 128kbps)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure bandwidth control:

```
DGS-3400:4#config bandwidth_control 1:1-1:8 rx_rate 64 tx_rate 64
Command: config bandwidth_control 1:1-1:8 rx_rate 64 tx_rate 64

Success.

DGS-3400:4#
```

show bandwidth_control

Purpose	Used to display the bandwidth control table.
Syntax	show bandwidth_control {<portlist>}
Description	The show bandwidth_control command displays the current bandwidth control configuration on the Switch, on a port-by-port basis.
Parameters	<portlist> – Specifies a port or range of ports to be viewed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest

show bandwidth_control

switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

Restrictions None.

Example usage:

To display bandwidth control settings:

DGS-3400:4#show bandwidth_control 1:1-1:10

Command: show bandwidth_control 1:1-1:10

Bandwidth Control Table

Port	RX Rate (64Kbit/sec)	TX Rate (64Kbit/sec)
1:1	no_limit	10
1:2	no_limit	10
1:3	no_limit	10
1:4	no_limit	10
1:5	no_limit	10
1:6	no_limit	10
1:7	no_limit	10
1:8	no_limit	10
1:9	no_limit	10
1:10	no_limit	10

DGS-3400:4#

config scheduling

Purpose Used to configure the traffic scheduling mechanism for each QoS queue.

Syntax **config scheduling <class_id 0-6> {max_packet <value 0-15>}**

Description The Switch contains 8 hardware priority queues, one of which is internal and not configurable. Incoming packets must be mapped to one of these seven queues. This command is used to specify the rotation by which these seven hardware priority queues are emptied.

The Switch's default (if the **config scheduling** command is not used, or if the **config scheduling** command is entered with the max_packet set to 0) is to empty the hardware priority queues in order – from the highest priority queue (hardware queue 6) to the lowest priority queue (hardware queue 0). Each hardware queue will transmit all of the packets in its buffer before allowing the next lower priority queue to transmit its packets. When the lowest hardware priority queue has finished transmitting all of its packets, the highest hardware priority queue can again transmit any packets it may have received.

The *max_packets* parameter allows you to specify the maximum number of packets a given hardware priority queue can transmit before allowing the next lowest hardware priority queue to begin transmitting its packets. A value between 0 and 15 can be specified. For example, if a value of 3 is specified, then the highest hardware priority queue (number 6) will be allowed to transmit 3 packets – then the next lowest hardware priority queue (number 5) will be allowed to transmit 3 packets, and so on, until all of the queues have transmitted 3 packets. The process will then repeat.

config scheduling

Parameters	<class_id 0-6> – This specifies to which of the seven hardware priority queues the config scheduling command will apply. The seven hardware priority queues are identified by number – from 0 to 6 – with the 0 queue being the lowest priority. max_packet <value 0-15> – Specifies the maximum number of packets the above specified hardware priority queue will be allowed to transmit before allowing the next lowest priority queue to transmit its packets. A value between 0 and 15 can be specified.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the traffic scheduling mechanism for each queue:

```
DGS-3400:4# config scheduling 0 max_packet 12
```

```
Command: config scheduling 0 max_packet 12
```

```
Success.
```

```
DGS-3400:4#
```

show scheduling

Purpose	Used to display the currently configured traffic scheduling on the Switch.
Syntax	show scheduling
Description	The show scheduling command will display the current traffic scheduling mechanisms in use on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To display the current scheduling configuration:

```
DGS-3400:4#show scheduling
```

```
Command: show scheduling
```

QOS Output Scheduling

Class ID	MAX. Packets
-----	-----

Class-5	6
Class-6	7

```
DGS-3400:4#
```

config 802.1p user_priority

Purpose	Used to map the 802.1p user priority of an incoming packet to one of the seven hardware queues available on the Switch.																											
Syntax	config 802.1p user_priority <priority 0-7> <class_id 0-6>																											
Description	This command allows users to configure the way the Switch will map an incoming packet, based on its 802.1p user priority, to one of the seven available hardware priority queues on the Switch. The Switch's default is to map the following incoming 802.1p user priority values to the seven hardware priority queues: <table><tr><th>802.1p</th><th>Hardware Queue</th><th>Remark</th></tr><tr><td>0</td><td>2</td><td>Mid-low</td></tr><tr><td>1</td><td>0</td><td>Lowest</td></tr><tr><td>2</td><td>1</td><td>Lowest</td></tr><tr><td>3</td><td>3</td><td>Mid-low</td></tr><tr><td>4</td><td>4</td><td>Mid-high</td></tr><tr><td>5</td><td>5</td><td>Mid-high</td></tr><tr><td>6</td><td>6</td><td>Highest</td></tr><tr><td>7</td><td>6</td><td>Highest</td></tr></table> This mapping scheme is based upon recommendations contained in IEEE 802.1D. Users may change this mapping by specifying the 802.1p user priority you want to go to the <class_id 0-6> (the number of the hardware queue). <priority 0-7> – The 802.1p user priority you want to associate with the <class_id 0-6> (the number of the hardware queue) with. <class_id 0-6> – The number of the Switch's hardware priority queue. The Switch has seven hardware priority queues available. They are numbered between 0 (the lowest priority) and 6 (the highest priority).	802.1p	Hardware Queue	Remark	0	2	Mid-low	1	0	Lowest	2	1	Lowest	3	3	Mid-low	4	4	Mid-high	5	5	Mid-high	6	6	Highest	7	6	Highest
802.1p	Hardware Queue	Remark																										
0	2	Mid-low																										
1	0	Lowest																										
2	1	Lowest																										
3	3	Mid-low																										
4	4	Mid-high																										
5	5	Mid-high																										
6	6	Highest																										
7	6	Highest																										
Restrictions	Only administrator-level users can issue this command.																											

Example usage:

To configure 802.1 user priority on the Switch:

```
DGS-3400:4# config 802.1p user_priority 1 6
Command: config 802.1p user_priority 1 6
```

Success.

```
DGS-3400:4#
```

show 802.1p user_priority

Purpose	Used to display the current mapping between an incoming packet's 802.1p priority value and one of the Switch's seven hardware priority queues.
Syntax	show 802.1p user_priority
Description	The show 802.1p user_priority command displays the current mapping of an incoming packet's 802.1p priority value to one of the Switch's seven hardware priority queues.
Parameters	None.
Restrictions	None.

Example usage:

To show 802.1p user priority:

```
DGS-3400:4#show 802.1p user_priority
Command: show 802.1p user_priority

QOS Class of Traffic

Priority-0 -> <Class-2>
Priority-1 -> <Class-0>
Priority-2 -> <Class-1>
Priority-3 -> <Class-3>
Priority-4 -> <Class-4>
Priority-5 -> <Class-5>
Priority-6 -> <Class-6>
Priority-7 -> <Class-6>

DGS-3400:4#
```

config 802.1p default_priority

Purpose	Used to configure the 802.1p default priority settings on the Switch. If an untagged packet is received by the Switch, the priority configured with this command will be written to the packet's priority field.
Syntax	config 802.1p default_priority [<portlist> all] <priority 0-7>
Description	This command allows specification of a default priority handling of untagged packets received by the Switch. The priority value entered with this command will be used to determine which of the seven hardware priority queues the packet is forwarded to.
Parameters	<portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specifies that the command applies to all ports on the Switch. <priority 0-7> – The priority value to assign to untagged packets received by the Switch or a range of ports on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure 802.1p default priority on the Switch:

```
DGS-3400:4#config 802.1p default_priority all 5
Command: config 802.1p default_priority all 5

Success.

DGS-3400:4#
```

show 802.1p default_priority

Purpose	Used to display the currently configured 802.1p priority value that will be assigned to an incoming, untagged packet before being forwarded to its destination.
Syntax	show 802.1p default_priority {<portlist>}
Description	The show 802.1p default_priority command displays the currently configured 802.1p priority value that will be assigned to an incoming, untagged packet before being forwarded to its destination.
Parameters	<portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None.

Example usage:

To display the current 802.1p default priority configuration on the Switch:

```
DGS-3400:4# show 802.1p default_priority
Command: show 802.1p default_priority
```

```
DGS-3400:4#
```

config scheduling_mechanism

Purpose	Used to configure the scheduling mechanism for the QoS function
Syntax	config scheduling_mechanism [strict weight_fair]
Description	The config scheduling_mechanism command allows the user to select between a weight fair and a Strict mechanism for emptying the priority classes of service of the QoS function. The Switch contains seven hardware priority classes of service. Incoming packets must be mapped to one of these seven hardware priority classes of service. This command is used to specify the rotation by which these seven hardware priority classes of service are emptied. The Switch's default is to empty the seven priority classes of service in order – from the highest priority class of service (queue 6) to the lowest priority class of service (queue 0). Each queue will transmit all of the packets in its buffer before allowing the next lower priority class of service to transmit its packets. Lower classes of service will be pre-empted from emptying its queue if a packet is received on a higher class of service. The packet that was received on the higher class of service will transmit its packet before allowing the lower class to resume clearing its queue.
Parameters	<i>strict</i> – Entering the <i>strict</i> parameter indicates that the highest class of service is the first to be processed. That is, the highest class of service should finish emptying before the others begin. <i>weight_fair</i> – Entering the <i>weight fair</i> parameter indicates that the priority classes of service will empty packets in a fair weighted order. That is to say that they will be emptied in an even distribution.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the traffic scheduling mechanism for each QoS queue:

```
DGS-3400:4#config scheduling_mechanism strict
Command: config scheduling_mechanism strict

Success.

DGS-3400:4#
```

show scheduling_mechanism

Purpose	Used to display the current traffic scheduling mechanisms in use on the Switch.
Syntax	show scheduling_mechanism
Description	This command will display the current traffic scheduling mechanisms in use on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To show the scheduling mechanism:

DGS-3400:4#show scheduling_mechanism

Command: show scheduling_mechanism

QOS scheduling_mechanism

CLASS ID Mechanism

```

-----
Class-0      strict
Class-1      strict
Class-2      strict
Class-3      strict
Class-4      strict
Class-5      strict
Class-6      strict

```

DGS-3400:4#

enable hol_prevention

Purpose	Used to enable HOL prevention.
Syntax	enable hol_prevention
Description	The enable hol_prevention command enables Head of Line prevention.
Parameters	None.
Restrictions	You must have administrator privileges.

Example usage:

To enable HOL prevention:

DGS-3400:4#enable hol_prevention

Command: enable hol_prevention

Success.

DGS-3400:4#

disable hol_prevention

Purpose	Used to disable HOL prevention.
Syntax	disable hol_prevention
Description	The disable hol_prevention command disables Head of Line prevention.
Parameters	None.
Restrictions	You must have administrator privileges.

Example usage:

To disable HOL prevention:

DGS-3400:4#disable hol_prevention

Command: disable hol_prevention

Success.

DGS-3400:4#

show hol_prevention

Purpose	Used to show HOL prevention.
Syntax	show hol_prevention
Description	The show hol_prevention command displays the Head of Line prevention state.
Parameters	None.
Restrictions	None.

Example usage:

To view the HOL prevention status:

```
DGS-3400:4#show hol_prevention
Command: show hol_prevention

Device HOL Prevention State: Enabled

DGS-3400:4#
```

PORT MIRRORING COMMANDS

The port mirroring commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config mirror port	<port> [add delete] source ports <portlist> [rx tx both]
enable mirror	
disable mirror	
show mirror	

Each command is listed, in detail, in the following sections.

config mirror port

Purpose	Used to configure a mirror port – source port pair on the Switch. Traffic from any source port to a target port can be mirrored for real-time analysis. A logic analyzer or an RMON probe can then be attached to study the traffic crossing the source port in a completely obtrusive manner.
Syntax	config mirror port <port> [add delete] source ports <portlist> [rx tx both]
Description	This command allows a range of ports to have all of their traffic also sent to a designated port, where a network sniffer or other device can monitor the network traffic. In addition, users can specify that only traffic received by or sent by one or both is mirrored to the Target port.
Parameters	<port> – This specifies the Target port (the port where mirrored packets will be received). The target port must be configured in the same VLAN and must be operating at the same speed as the source port. If the target port is operating at a lower speed, the source port will be forced to drop its operating speed to match that of the target port. The port is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. [add delete] – Specifies to add or delete ports to be mirrored which are specified in the <i>source ports</i> parameter. source ports – The port or ports being mirrored. This cannot include the Target port. <portlist> – This specifies a port or range of ports that will be mirrored. That is, the range of ports in which all traffic will be copied and sent to the Target port. That is, the range of ports in which all traffic will be copied and sent to the Target port. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) rx – Allows the mirroring of only packets received by (flowing into) the port or ports in the port list.

config mirror port

	<i>tx</i> – Allows the mirroring of only packets sent to (flowing out of) the port or ports in the port list.
	<i>both</i> – Mirrors all the packets received or sent by the port or ports in the port list.
Restrictions	The Target port cannot be listed as a source port. Only administrator-level users can issue this command.

Example usage:

To add the mirroring ports:

```
DGS-3400:4# config mirror port 1:1 add source ports 1:2-1:7 both
Command: config mirror port 1:1 add source ports 1:2-1:7 both

Success.

DGS-3400:4#
```

Example usage:

To delete the mirroring ports:

```
DGS-3400:4#config mirror port 1:1 delete source ports 1:2-1:4 both
Command: config mirror port 1:1 delete source ports 1:2-1:4 both

Success.

DGS-3400:4#
```

enable mirror

Purpose	Used to enable a previously entered port mirroring configuration.
Syntax	enable mirror
Description	This command, combined with the disable mirror command below, allows users to enter a port mirroring configuration into the Switch, and then turn the port mirroring on and off without having to modify the port mirroring configuration.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable mirroring configurations:

```
DGS-3400:4#enable mirror
Command: enable mirror

Success.

DGS-3400:4#
```

disable mirror

Purpose	Used to disable a previously entered port mirroring configuration.
Syntax	disable mirror
Description	This command, combined with the enable mirror command above, allows users to enter a port mirroring configuration into the Switch,

disable mirror

	and then turn the port mirroring on and off without having to modify the port mirroring configuration.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable mirroring configurations:

```
DGS-3400:4#disable mirror
Command: disable mirror

Success.

DGS-3400:4#
```

show mirror

Purpose	Used to show the current port mirroring configuration on the Switch.
Syntax	show mirror
Description	This command displays the current port mirroring configuration on the Switch.
Parameters	None
Restrictions	None.

Example usage:

To display mirroring configuration:

```
DGS-3400:4#show mirror
Command: show mirror

Current Settings
Mirror Status : Enabled
Target Port   : 1:1
Mirrored Port :
    RX :
    TX : 1:2-1:7

DGS-3400:4#
```

VLAN COMMANDS

Along with normal VLAN configurations, this Switch now incorporate Double VLANs. Better known as Q-IN-Q VLANs, Double VLANs allow network providers to expand their VLAN configurations to place VLANs within a larger inclusive VLAN, which adds a new layer to the VLAN configuration. This basically lets large ISP's create L2 Virtual Private Networks and also create transparent LANs for their customers, which will connect two or more customer LAN points without over complicating configurations on the client's side. Not only will over-complication be avoided, but now the administrator has over 4000 VLANs in which over 4000 VLANs can be placed, therefore greatly expanding the VLAN network.

Implementation of this feature adds a VLAN frame to an existing VLAN frame for the ISP VLAN recognition and classification. To ensure devices notice this added VLAN frame, an Ethernet encapsulation, here known as a tpid, is also added to the frame. The device recognizes this tpid and therefore checks the VLAN tagged packet to see if a provider VLAN tag has been added. If so, the packet is then routed through this provider VLAN, which contains smaller VLANs with similar configurations to ensure speedy and guaranteed routing destination of the packet.

The xStack DGS-3400 series now incorporates protocol-based VLANs. This standard, defined by the IEEE 802.1v standard maps packets to protocol-defined VLANs by examining the type octet within the packet header to discover the type of protocol associated with it. After assessing the protocol, the Switch will forward the packets to all ports within the protocol-assigned VLAN. This feature will benefit the administrator by better balancing load sharing and enhancing traffic classification. The Switch supports fourteen (14) pre-defined protocols for configuring protocol-based VLANs. The user may also choose a protocol that is not one of the fourteen defined protocols by properly configuring the *userDefined* protocol VLAN. The supported protocols for the protocol VLAN function on this Switch include IP, IPX, DEC LAT, SNAP, NetBIOS, AppleTalk, XNS, SNA, IPv6, RARP and VINES.

The VLAN commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create vlan	<vlan_name 32> {tag <vlanid 2-4094> {type {1q_vlan {advertisement} [protocol-ip protocol-ipx802dot3 protocol-ipx802dot2 protocol-ipxSnap protocol-ipxEthernet2 protocol-appleTalk protocol-decLat protocol-sna802dot2 protocol-snaEthernet2 protocol-netBios protocol-xns protocol-vines protocol-ipV6 protocol-userDefined <hex0x0-0xffff> encap [ethernet llc snap all] protocol-rarp]}}
delete vlan	<vlan_name 32>
config vlan	<vlan_name 32> {[add [tagged untagged forbidden] delete] <portlist> advertisement [enable disable]}
config gvrp	[<portlist> all] {state [enable disable] ingress_checking [enable disable] acceptable_frame [tagged_only admit_all] pvid <vlanid 1-4094>}
enable gvrp	
disable gvrp	
show vlan	{[<vlan_name 32>] type [1q_vlan protocol]}
show gvrp	{<portlist>}
enable double_vlan	
disable double_vlan	
create double_vlan	<vlan_name 32> spvid <vlanid 1-4094> {tpid <hex 0x0-0xffff>}
config double_vlan	<vlan_name> {[add [access uplink] delete] <portlist> tpid <hex 0x0-0xffff>}
delete double_vlan	<vlan_name>
show double_vlan	{<vlan_name>}

Each command is listed, in detail, in the following sections.

NOTE: A specific protocol VLAN and a user defined protocol VLAN with the same encapsulation protocol cannot coexist and will result in a *Fail!* Message. (For example, if a user creates an *Ethernet2* protocol VLAN, the user can not create a *userDefined* protocol VLAN with an Ethernet encapsulation)

create vlan

Purpose	Used to create a VLAN on the Switch.
Syntax	create vlan <vlan_name 32> {tag <vlanid 2-4094> [advertisement {type {1q_vlan [protocol-ip protocol-ipx802dot3 protocol-ipx802dot2 protocol-ipxSnap protocol-ipxEthernet2 protocol-appleTalk protocol-decLat protocol-decOther protocol-sna802dot2 protocol-snaEthernet2 protocol-netBios protocol-xns protocol-vines protocol-ipV6 protocol-userDefined <hex0x0-0xffff> encap [ethernet llc snap all] protocol-rarp}}]}
Description	This command allows the creation of a VLAN on the Switch. The user may choose between an 802.1Q VLAN or a protocol-based VLAN.
Parameters	<vlan_name 32> – The name of the VLAN to be created. tag <vlanid 2-4094> – The VLAN ID of the VLAN to be created. Allowed values = 2-4094 type – This parameter uses the <i>type</i> field of the packet header to determine the packet protocol and destination VLAN. There are two main choices of types for VLANs created on the Switch: 1q_vlan – Allows the creation of a normal 802.1Q VLAN on the Switch. advertisement – Specifies that the VLAN is able to join GVRP. If this parameter is not set, the switch cannot send any GVRP messages regarding the VLAN. The following parameters allow for the creation of protocol-based VLANs. The Switch supports 14 pre-configured protocol-based VLANs plus a user defined protocol based VLANs where the administrator may configure the settings for the appropriate protocol and forwarding of packets (15 total). Selecting a specific protocol will indicate which protocol will be utilized in determining the VLAN ownership of a tagged packet. Pre-set protocol-based VLANs on the Switch include: protocol-ip – Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is based on the Ethernet protocol. protocol-ipx802dot3 - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by Novell NetWare 802.3 (IPX - Internet Packet Exchange). protocol-ipx802dot2 - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by Novell NetWare 802.2 (IPX - Internet Packet Exchange). protocol-ipxSnap - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by Novell and the Sub Network Access Protocol (SNAP). protocol-ipxEthernet2 - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by Novell Ethernet II Protocol. protocol-appleTalk - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the AppleTalk

create vlan

protocol.

- *protocol-decLAT* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Digital Equipment Corporation (DEC) Local Area Transport (LAT) protocol.
- *protocol-sna802dot2* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Systems Network Architecture (SNA) 802.2 Protocol.
- *protocol-snaEthernet2* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Systems Network Architecture (SNA) Ethernet II Protocol.
- *protocol-netBios* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the NetBIOS Protocol.
- *protocol-xns* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Xerox Network Systems (XNS) Protocol.
- *protocol-vines* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Banyan Virtual Integrated Network Service (VINES) Protocol.
- *protocol-ipV6* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Internet Protocol Version 6 (IPv6) Protocol.

protocol-userDefined - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol defined by the user. This packet header information is defined by entering the following information:

- *<hex 0x0-0xffff>* - Specifies that the VLAN will only accept packets with this hexadecimal protocol value in the packet header.
- *encap [ethernet | llc | snap | all]* - Specifies that the Switch will examine the octet of the packet header referring to one of the protocols listed (Ethernet, LLC or SNAP), looking for a match of the hexadecimal value previously entered. *all* will instruct the Switch to examine the total packet header. After a match is found, the Switch will forward the packet to this VLAN.
- *protocol-rarp* - Using this parameter will instruct the Switch to forward packets to this VLAN if the tag in the packet header is concurrent with this protocol. This packet header information is defined by the Reverse Address Resolution (RARP) Protocol.

Restrictions

Each VLAN name can be up to 32 characters. If the VLAN is not given a tag, it will be a port-based VLAN. Only administrator-level users can issue this command.

Example usage:

To create a protocol VLAN:

DGS-3400:4#create vlan v5 tag 2 protocol-ipxSnap

Command: create vlan v5 tag 2 protocol-ipxSnap

Success.

DGS-3400:4#

Example usage:

To create a VLAN v1, tag 2:

```
DGS-3400:4#create vlan v1 tag 2
Command: create vlan v1 tag 2

Success.

DGS-3400:4#
```

delete vlan

Purpose	Used to delete a previously configured VLAN on the Switch.
Syntax	delete vlan <vlan_name 32>
Description	This command will delete a previously configured VLAN on the Switch.
Parameters	<vlan_name 32> – The VLAN name of the VLAN to delete.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To remove the VLAN “v1”:

```
DGS-3400:4#delete vlan v1
Command: delete vlan v1

Success.

DGS-3400:4#
```

config vlan

Purpose	Used to add additional ports to a previously configured VLAN.
Syntax	config vlan <vlan_name 32> {[add [tagged untagged forbidden] delete] <portlist> advertisement [enable disable]}
Description	This command allows the addition of ports to the port list of a previously configured VLAN. The additional ports may be specified as tagging, untagging, or forbidden. The default is to assign the ports as untagging.
Parameters	<vlan_name 32> – The name of the VLAN to which to add ports. <i>add</i> – Entering the add parameter will add ports to the VLAN. There are three types of ports to add: • <i>tagged</i> – Specifies the additional ports as tagged. • <i>untagged</i> – Specifies the additional ports as untagged. • <i>forbidden</i> – Specifies the additional ports as forbidden <i>delete</i> – Deletes ports from the specified VLAN. <portlist> – A port or range of ports to add to, or delete from the specified VLAN. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>advertisement [enable disable]</i> – Enables or disables GVRP on the

config vlan

specified VLAN.

Restrictions	Only administrator-level users can issue this command.
--------------	--

Example usage:

To add 4 through 8 as tagged ports to the VLAN v1:

```
DGS-3400:4#config vlan v1 add tagged 1:4-1:8
```

```
Command: config vlan v1 add tagged 1:4-1:8
```

```
Success.
```

```
DGS-3400:4#
```

To delete ports from a VLAN:

```
DGS-3400:4#config vlan v1 delete 1:6-1:8
```

```
Command: config vlan v1 delete 1:6-1:8
```

```
Success.
```

```
DGS-3400:4#
```

config gvrp

Purpose	Used to configure GVRP on the Switch.
Syntax	config gvrp [<portlist> all] {state [enable disable] ingress_checking [enable disable] acceptable_frame [tagged_only admit_all] pvid <vlanid 1-4094>}
Description	This command is used to configure the Group VLAN Registration Protocol on the Switch. Users may configure ingress checking, the sending and receiving of GVRP information, and the Port VLAN ID (PVID).
Parameters	<portlist> – A port or range of ports for which to enable GVRP. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specifies all of the ports on the Switch. state [enable disable] – Enables or disables GVRP for the ports specified in the port list. ingress_checking [enable disable] – Enables or disables ingress checking for the specified port list. acceptable_frame [tagged_only admit_all] – This parameter states the frame type that will be accepted by the Switch for this function. tagged_only implies that only VLAN tagged frames will be accepted, while admit_all implies tagged and untagged frames will be accepted by the Switch. pvid <vlanid 1-4094> – Specifies the default VLAN ID associated with the port.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To set the ingress checking status, the sending and receiving GVRP information :

```
DGS-3400:4#config gvrp 1:1-1:4 state enable ingress_checking enable
acceptable_frame tagged_only pvid 2
Command: config gvrp 1:1-1:4 state enable ingress_checking enable
acceptable_frame tagged_only pvid 2

Success.

DGS-3400:4#
```

enable gvrp

Purpose	Used to enable GVRP on the Switch.
Syntax	enable gvrp
Description	This command, along with disable gvrp below, is used to enable and disable GVRP on the Switch, without changing the GVRP configuration on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable the GARP VLAN Registration Protocol (GVRP):

```
DGS-3400:4#enable gvrp
Command: enable gvrp

Success.

DGS-3400:4#
```

disable gvrp

Purpose	Used to disable GVRP on the Switch.
Syntax	disable gvrp
Description	This command, along with enable gvrp , is used to enable and disable GVRP on the Switch, without changing the GVRP configuration on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the GARP VLAN Registration Protocol (GVRP):

```
DGS-3400:4#disable gvrp
Command: disable gvrp

Success.

DGS-3400:4#
```

show vlan

Purpose	Used to display the current VLAN configuration on the Switch
Syntax	show vlan {<vlan_name 32>}
Description	This command displays summary information about each VLAN including the VLAN ID, VLAN name, the Tagging/Untagging status, and the Member/Non-member/Forbidden status of each port that is a member of the VLAN.
Parameters	<vlan_name 32> – The VLAN name of the VLAN for which to display a summary of settings.
Restrictions	None.

Example usage:

To display the Switch's current VLAN settings:

```
DGS-3400:4#show vlan
Command: show vlan

VID          : 1          VLAN Name   : default

```

show gvrp

Purpose	Used to display the GVRP status for a port list on the Switch.
Syntax	show gvrp {<portlist>}
Description	This command displays the GVRP status for a port list on the Switch.
Parameters	<portlist> – Specifies a port or range of ports for which the GVRP status is to be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated

show gvrp

by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

Restrictions None.

Example usage:

To display GVRP port status:

```
DGS-3400:4#show gvrp
Command: show gvrp

Global GVRP : Disabled
```

Port	PVID	GVRP	Ingress Checking	Acceptable Frame Type

DGS-3400:4#
```

enable double_vlan

Purpose	Used to enable the Double VLAN feature on the Switch.
Syntax	enable double_vlan
Description	This command, along with the disable double_vlan command, enables and disables the Double Tag VLAN. When Double VLANs are enabled, the system configurations for VLANs will return to the default setting, except stacking information, IP address, log, user accounts and banner setting, in order to enable the Double VLAN mode. In the Double VLAN mode, normal VLANs and GVRP functions are disabled. The Double VLAN default setting is disabled.
Parameters	None.

enable double_vlan

Restrictions	Only administrator-level users can issue this command.
--------------	--

Example usage:

To enable the Double VLAN feature on the Switch, thus disabling normal VLANs and GVRP.

```
DGS-3400:4#enable double_vlan
Command: enable double_vlan
Current Double VLAN mode : Disabled
Enable Double VLAN need to reset system config. Are you sure?(y/n)y

Success.

DGS-3400:4#
```

disable double_vlan

Purpose	Used to disable the Double VLAN feature on the Switch.
Syntax	disable double_vlan
Description	This command, along with the enable double_vlan command, enables and disables the Double Tag VLAN. When Double VLANs are enabled, the system configurations for VLANs will return to the default setting, except stacking information, IP address, log, user accounts and banner setting, in order to enable the Double VLAN mode. In the Double VLAN mode, normal VLANs and GVRP functions are disabled. The Double VLAN default setting is disabled.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the Double VLAN feature on the Switch

```
DGS-3400:4#disable double_vlan
Command: disable double_vlan
Current Double VLAN mode : Enabled
Disable Double VLAN need to reset system config. Are you sure?(y/n)y

Success.

DGS-3400:4#
```

create double_vlan

Purpose	Used to create a Double VLAN on the Switch.
Syntax	create double_vlan <vlan_name 32> spvid <vlanid 1-4094> {tpid <hex 0x0-0xffff>}
Description	This command is used to create a Double VLAN (service provider VLAN) on the Switch.
Parameters	<i>vlan <vlan_name 32></i> - The name of the Double VLAN to be created. The user is to enter an alphanumeric string of up to 32 characters to identify this VLAN. <i>spvid <vlanid 1-4094></i> - The VLAN ID of the service provider VLAN. The user is to identify this VLAN with a number between 1 and 4094. <i>tpid <hex 0x0-0xffff></i> - The tag protocol ID. This ID, identified here in

create double_vlan

	hex form, will help identify packets to devices as Double VLAN tagged packets. The default setting is 0x8100.
Restrictions	Only administrator-level users can issue this command. Users must have the Switch enabled for Double VLANs.

DGS-3400:4#create double_vlan Trinity spvid 6 tpid 0x9100
Command: create double_vlan Trinity spvid 6 tpid 0x9100

Success.

DGS-3400:4#

config double_vlan

Purpose	Used to config the parameters for a previously created Double VLAN on the Switch.
Syntax	config double_vlan <vlan_name> {[add [access uplink] delete] <portlist> tpid <hex 0x0-0xffff>]}
Description	This command is used to configure a Double VLAN (service provider VLAN) on the Switch.
Parameters	<i>vlan</i> <vlan_name 32> - The name of the Double VLAN to be configured. The user is to enter an alphanumeric string of up to 32 characters to identify this VLAN. <i>add</i> – Specify this parameter to add ports configured in the <portlist> as one of the two following types of ports. <i>uplink</i> – Add this parameter to configure these ports as uplink ports. Uplink ports are for connecting Switch VLANs to the Provider VLANs on a remote source. Only gigabit ports can be configured as uplink ports. <i>access</i> - Add this parameter to configure these ports as access ports. Access ports are for connecting Switch VLANs to customer VLANs. <i>portlist</i> – Enter a list of ports to be added to this VLAN. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>delete</i> - Specify this parameter to delete ports configured in the <portlist> from this VLAN. <i>portlist</i> – Enter a list of ports to be deleted from this VLAN. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist

config double_vlan

entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

tpid <hex 0x0-0xffff>- The tag protocol ID. This ID, identified here in hex form, will help identify packets to devices as Double VLAN tagged packets. The default setting is 0x8100.

Restrictions

Only administrator-level users can issue this command.

Users must have the Switch enabled for Double VLANs.

Example usage:

To add ports 4 through 8 as access ports to the Double VLAN Trinity:

DGS-3400:4#config double_vlan Trinity add access 1:4-1:8

Command: config double_vlan Trinity add access 1:4-1:8

Success.

DGS-3400:4#

Example usage:

To delete ports 4 through 8 on the Double VLAN Trinity:

DGS-3400:4#config double_vlan Trinity delete 1:4-1:8

Command: config double_vlan Trinity delete 1:4-1:8

Success.

DGS-3400:4#

show double_vlan**Purpose**

Used to display the Double VLAN settings on the Switch.

Syntax

show double_vlan {<vlan_name>}

Description

This command will display the current double VLAN parameters configured on the Switch.

Parameters

vlan name - Enter the name of a previously created VLAN for which to display the settings.

Restrictions

Only administrator-level users can issue this command.

Users must have the Switch enabled for Double VLANs.

Example usage:

To display parameters for the Double VLAN Trinity:

DGS-3400:4#show double_vlan Trinity

Command: show double_vlan Trinity

Global Double VLAN : Enabled

LINK AGGREGATION COMMANDS

The link aggregation commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create link_aggregation group_id	<value 1-32> {type [lacp static]}
delete link_aggregation group_id	<value 1-32>
config link_aggregation group_id	<value 1-32> {master_port <port> ports <portlist> state [enable disable]}
config link_aggregation algorithm	[mac_source mac_destination mac_source_dest ip_source ip_destination ip_source_dest]
show link_aggregation	{group_id <value 1-32> algorithm}
config lacp_port	<portlist> mode [active passive]
show lacp_port	{<portlist>}

Each command is listed, in detail, in the following sections.

create link_aggregation

Purpose	Used to create a link aggregation group on the Switch.
Syntax	create link_aggregation group_id <value 1-32> {type [lacp static]}
Description	This command will create a link aggregation group with a unique identifier.
Parameters	<value> – Specifies the group ID. The Switch allows up to 32 link aggregation groups to be configured. The group number identifies each of the groups. type – Specify the type of link aggregation used for the group. If the type is not specified the default type is <i>static</i>. lacp – This designates the port group as LACP compliant. LACP allows dynamic adjustment to the aggregated port group. LACP compliant ports may be further configured (see config lacp_ports). LACP compliant must be connected to LACP compliant devices. static – This designates the aggregated port group as static. Static port groups can not be changed as easily as LACP compliant port groups since both linked devices must be manually configured if the configuration of the trunked group is changed. If static link aggregation is used, be sure that both ends of the connection are properly configured and that all ports have the same speed/duplex settings.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create a link aggregation group:

```
DGS-3400:4#create link_aggregation group_id 1
Command: create link_aggregation group_id 1
```

Success.

```
DGS-3400:4#
```

NOTE: When using LACP or static type link aggregation, be sure that both sides of the connection are identical in speed and duplex settings.

delete link_aggregation group_id

Purpose	Used to delete a previously configured link aggregation group.
Syntax	delete link_aggregation group_id <value 1-32>
Description	This command is used to delete a previously configured link aggregation group.
Parameters	<i><value 1-32></i> – Specifies the group ID. The Switch allows up to 32 link aggregation groups to be configured. The group number identifies each of the groups.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete link aggregation group:

```
DGS-3400:4#delete link_aggregation group_id 6
Command: delete link_aggregation group_id 6
```

```
Success.
```

```
DGS-3400:4#
```

config link_aggregation

Purpose	Used to configure a previously created link aggregation group.
Syntax	config link_aggregation group_id <value 1-32> {master_port <port> ports <portlist> state [enable disable]}
Description	This command allows configuration of a link aggregation group that was created with the create link_aggregation command above. The DGS-3400 supports link aggregation cross box which specifies that link aggregation groups may be spread over multiple switches in the switching stack. Up to eight ports can be set per link aggregation group.
Parameters	<i>group_id <value 32></i> – Specifies the group ID. The Switch allows up to 32 link aggregation groups to be configured. The group number identifies each of the groups. <i>master_port <port></i> – Master port ID. Specifies which port (by port number) of the link aggregation group will be the master port. All of the ports in a link aggregation group will share the port configuration with the master port. The port is specified by listing the switch number and the port number on that switch, separated by a colon. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. <i>ports <portlist></i> – Specifies a range of ports that will belong to the link aggregation group. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) Ports may be listed in only one port aggregation group, that is, link aggregation groups may not

config link_aggregation

	overlap. Up to eight ports can be set per link aggregation group.
	<i>state [enable disable]</i> – Allows users to enable or disable the specified link aggregation group.
Restrictions	Only administrator-level users can issue this command. Link aggregation groups may not overlap.

Example usage:

To define a load-sharing group of ports, group-ID 1, master port 5 with group members ports 5-7 plus port 9:

```
DGS-3400:4#config link_aggregation group_id 1 master_port 1:5 ports 1:5-1:7,1:9
Command: config link_aggregation group_id 1 master_port 1:5 ports 1:5-1:7,1:9

Success.

DGS-3400:4#
```

config link_aggregation algorithm

Purpose	Used to configure the link aggregation algorithm.
Syntax	config link_aggregation algorithm [mac_source mac_destination mac_source_dest ip_source ip_destination ip_source_dest]
Description	This command configures the part of the packet examined by the Switch when selecting the egress port for transmitting load-sharing data. This feature is only available using the address-based load-sharing algorithm.
Parameters	<i>mac_source</i> – Indicates that the Switch should examine the MAC source address. <i>mac_destination</i> – Indicates that the Switch should examine the MAC destination address. <i>mac_source_dest</i> – Indicates that the Switch should examine the MAC source and destination addresses <i>ip_source</i> – Indicates that the Switch should examine the IP source address. <i>ip_destination</i> – Indicates that the Switch should examine the IP destination address. <i>ip_source_dest</i> – Indicates that the Switch should examine the IP source address and the destination address.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure link aggregation algorithm for mac-source-dest:

```
DGS-3400:4#config link_aggregation algorithm mac_source_dest
Command: config link_aggregation algorithm mac_source_dest

Success.

DGS-3400:4#
```

show link_aggregation

Purpose	Used to display the current link aggregation configuration on the Switch.
Syntax	show link_aggregation {group_id <value 1-32> algorithm}

show link_aggregation

Description	This command will display the current link aggregation configuration of the Switch.
Parameters	<value 1-32> – Specifies the group ID. The Switch allows up to 32 link aggregation groups to be configured. The group number identifies each of the groups. algorithm – Allows the display of link aggregation to be specified by the algorithm in use.
Restrictions	None.

Example usage:

To display Link Aggregation configuration:

```
DGS-3400:4#show link_aggregation
Command: show link_aggregation

Link Aggregation Algorithm = MAC-source-dest

Group ID      : 1
Type          : LACP
Master Port   : 1:5
Member Port   : 1:5-1:7,1:9
Active Port   :
Status        : Disabled
Flooding Port :

DGS-3400:4#
```

config lacp_port

Purpose	Used to configure settings for LACP compliant ports.
Syntax	config lacp_port <portlist> mode [active passive]
Description	This command is used to configure ports that have been previously designated as LACP ports (see create link_aggregation).
Parameters	<portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. mode – Select the mode to determine if LACP ports will process LACP control frames. active – Active LACP ports are capable of processing and sending LACP control frames. This allows LACP compliant devices to negotiate the aggregated link so the group may be changed dynamically as needs require. In order to utilize the ability to change an aggregated port group, that is, to add or subtract ports from the group, at least one of the participating devices must designate LACP ports as active. Both devices must support LACP. passive – LACP ports that are designated as passive can only process LACP control frames and cannot actively send these frames. In order to allow the linked port group to negotiate adjustments and make changes dynamically, at one end of the connection must have “active” LACP ports (see above).

config lacp_port

Restrictions	Only administrator-level users can issue this command.
--------------	--

Example usage:

To configure LACP port mode settings:

```
DGS-3400:4#config lacp_port 1:1-1:12 mode active
Command: config lacp_port 1:1-1:12 mode active

Success.

DGS-3400:4#
```

show lacp_port

Purpose	Used to display current LACP port mode settings.
Syntax	show lacp_port {<portlist>}
Description	This command will display the LACP mode settings as they are currently configured.
Parameters	<portlist> - Specifies a port or range of ports to be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) If no parameter is specified, the system will display the current LACP status for all ports.
Restrictions	None.

Example usage:

To display LACP port mode settings:

```
DGS-3400:4#show lacp_port 1:1-1:10
Command: show lacp_port 1:1-1:10

Port    Activity
-----  -
1:1      Active
1:2      Active
1:3      Active
1:4      Active
1:5      Active
1:6      Active
1:7      Active
1:8      Active
1:9      Active
1:10     Active

DGS-3400:4#
```

IP-MAC BINDING COMMANDS

The IP network layer uses a four-byte address. The Ethernet link layer uses a six-byte MAC address. Binding these two address types together allows the transmission of data between the layers. The primary purpose of IP-MAC binding is to restrict the access to a switch to a number of authorized users. Only the authorized client can access the Switch's port by checking the pair of IP-MAC addresses with the pre-configured database. If an unauthorized user tries to access an IP-MAC binding enabled port, the system will block the access by dropping its packet. The maximum number of IP-MAC binding entries is dependant on chip capability (e.g. the ARP table size) and storage size of the device. For the xStack DGS-3400 series, the maximum number of IP-MAC Binding entries is 512. The creation of authorized users can be manually configured by CLI or Web. The function is port-based, meaning a user can enable or disable the function on the individual port.

ACL Mode

Due to some special cases that have arisen with the IP-MAC binding, this Switch has been equipped with a special ACL Mode for IP-MAC Binding, which should alleviate this problem for users. When enabled, the Switch will create two entries in the Access Profile Table. The entries may only be created if there are at least two Profile IDs available on the Switch. If not, when the ACL Mode is enabled, an error message will be prompted to the user. When the ACL Mode is enabled, the Switch will only accept packets from a created entry in the IP-MAC Binding Setting window. All others will be discarded.

To configure the ACL mode, the user must first create an IP-MAC binding using the **create address_binding ip_mac ipaddress** command and select the mode as *ACL*. Then the user must enable the mode by entering the **enable address_binding acl_mode** command. If an IP-MAC binding entry is created and the user wishes to change it to an ACL mode entry, the user may use the **config address_binding ip_mac ipaddress** command and select the mode as *ACL*.

NOTE: When configuring the ACL mode function of the IP-MAC binding function, please pay close attention to previously set ACL entries. Since the ACL mode entries will fill the first two available access profiles and access profile IDs denote the ACL priority, the ACL mode entries may take precedence over other configured ACL entries. This may render some user-defined ACL parameters inoperable due to the overlapping of settings combined with the ACL entry priority (defined by profile ID). For more information on ACL settings, please see "Configuring the Access Profile" section mentioned previously in this chapter.

NOTE: Once ACL profiles have been created by the Switch through the IP-MAC binding function, the user cannot modify, delete or add ACL rules to these ACL mode access profile entries. Any attempt to modify, delete or add ACL rules will result in a configuration error as seen in the previous figure.

NOTE: When downloading configuration files to the Switch, be aware of the ACL configurations loaded, as compared to the ACL mode access profile entries set by this function, which may cause both access profile types to experience problems.

The IP-MAC Binding commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create address_binding ip_mac ipaddress	<ipaddr> mac_address <macaddr> {ports [portlist all]} mode [arp acl]}
config address_binding ip_mac ipaddress	<ipaddr> mac_address <macaddr> {ports [portlist all]} mode [arp acl]}
config address_binding ip_mac ports	[<portlist> all] state [enable disable]
show address_binding	[ip_mac {[all ipaddress <ipaddr> mac_address <macaddr>]} blocked {[all vlan_name <vlan_name> mac_address <macaddr>]} ports]
delete address_binding	[ip_mac [ipaddress <ipaddr> mac_address <macaddr> all] blocked [all vlan_name <vlan_name> mac_address <macaddr>]]

Command	Parameters
create address_binding ip_mac ipaddress	<ipaddr> mac_address <macaddr> {ports [portlist all]} mode [arp acl]}
enable address_binding acl_mode	
disable address_binding acl_mode	
enable address_binding trap_log	
disable address_binding trap_log	

Each command is listed, in detail, in the following sections.

create address_binding ip_mac ipaddress

Purpose	Used to create an IP-MAC Binding entry.
Syntax	create address_binding ip_mac ipaddress <ipaddr> mac_address <macaddr> {ports [<portlist> all] mode {arp acl}}
Description	This command will create an IP-MAC Binding entry.
Parameters	<ipaddr> The IP address of the device where the IP-MAC binding is made. <macaddr> The MAC address of the device where the IP-MAC binding is made. <portlist> - Specifies a port or range of ports to be configured for address binding. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Specifies that all ports on the switch will be configured for address binding. <i>mode</i> – The user may set the mode for this IP-MAC binding settings by choosing one of the following: • <i>arp</i> - Choosing this selection will set a normal IP-MAC Binding entry for the IP address and MAC address entered. • <i>acl</i> - Choosing this entry will allow only packets from the source IP-MAC binding entry created here. All other packets with a different IP address will be discarded by the Switch. This mode can only be used if the ACL Mode has been enabled in the IP-MAC Binding Ports window as seen previously.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create address binding on the Switch:

```
DGS-3400:4#create address_binding ip_mac ipaddress 10.1.1.3
mac_address 00-00-00-00-00-04
Command: create address_binding ip_mac ipaddress 10.1.1.3
mac_address 00-00-00-00-00-04

Success.

DGS-3400:4#
```

To create address binding on the Switch for ACL mode:

```
DGS-3400:4#create address_binding ip_mac ipaddress 10.1.1.3 mac_address
00-00-00-00-00-04 mode acl
Command: create address_binding ip_mac ipaddress 10.1.1.3 mac_address
00-00-00-00-00-04 mode acl
```

Success.

```
DGS-3400:4#
```

Once the ACL mode has been created and enabled (without previously created access profiles), the access profile table will look like this:

```
DGS-3400:4#show access_profile
Command: show access_profile
```

Access Profile Table

```
Access Profile ID : 1                                TYPE: Ethernet
```

```
=====
```

```
Owner           : IP-MAC-PORT Binding
```

```
Mask Option    :
```

```
Ethernet Type
```

```
-----
```

```
Access ID : 1                                Mode: Deny
```

```

```
-----
```

```
0x800
```

```
=====
```

```
Total Rule Entries: 1
```

```
DGS-3400:4#
```

The **show access_profile** command will display the two access profiles created and their corresponding rules for every port on the Switch.

config address_binding ip_mac ipaddress

Purpose	Used to configure a IP-MAC Binding entry.
Syntax	config address_binding ip_mac ipaddress <ipaddr> mac_address <macaddr> {ports [portlist all]} mode {arp acl}}
Description	This command will configure an IP-MAC Binding entry.
Parameters	<ipaddr> The IP address of the device where the IP-MAC binding is made. <macaddr> The MAC address of the device where the IP-MAC binding is made. ports [portlist all] – Used to specify the ports where the IP-MAC binding entry applies. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) mode – The user may set the mode for this IP-MAC binding settings by choosing one of the following: - arp - Choosing this selection will set a normal IP-MAC Binding entry for the IP address and MAC address entered. - acl - Choosing this entry will allow only packets from the source IP-MAC binding entry created here. All other packets with a different IP address will be discarded by the Switch.

config address_binding ip_mac ipaddress

Restrictions	Only administrator-level users can issue this command.
--------------	--

Example usage:

To configure address binding on the Switch:

```
DGS-3400:4#config address_binding ip_mac ipaddress 10.1.1.3
mac_address 00-00-00-00-00-05
Command: config address_binding ip_mac ipaddress 10.1.1.3
mac_address 00-00-00-00-00-05

Success.

DGS-3400:4#
```

To configure address binding on the Switch for ACL mode:

```
DGS-3400:4#config address_binding ip_mac ipaddress 10.1.1.3
mac_address 00-00-00-00-00-05 mode acl
Command: config address_binding ip_mac ipaddress 10.1.1.3
mac_address 00-00-00-00-00-05 mode acl

Success.

DGS-3400:4#
```

config address_binding ip_mac ports

Purpose	Used to configure an IP-MAC state to enable or disable for specified ports.
Syntax	config address_binding ip_mac ports [<portlist> all] state [enable disable]
Description	This command will configure IP-MAC state to enable or disable for specified ports.
Parameters	<portlist> – Specifies a port or range of port to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specifies all ports on the switch. state [enable disable] – Enables or disables the specified range of ports.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure address binding on the Switch:

```
DGS-3400:4#config address_binding ip_mac ports 1:2 state enable
Command: config address_binding ip_mac ports 1:2 state enable

Success.

DGS-3400:4#
```

show address_binding

Purpose	Used to display IP-MAC Binding entries.
Syntax	show address_binding [ip_mac {[all ipaddress <ipaddr> mac_address <macaddr>]} blocked {[all vlan_name <vlan_name> mac_address <macaddr>]} ports]
Description	This command will display IP-MAC Binding entries. Three different kinds of information can be viewed. • <i>ip_mac</i> –Address Binding entries can be viewed by entering the physical and IP addresses of the device. • <i>blocked</i> – Blocked address binding entries (bindings between VLAN names and MAC addresses) can be viewed by entering the VLAN name and the physical address of the device. • <i>ports</i> - The number of enabled ports on a device.
Parameters	<i>all</i> – For IP-MAC binding <i>all</i> specifies all the IP-MAC binding entries; for Blocked Address Binding entries <i>all</i> specifies all the blocked VLANs and their bound physical addresses. <ipaddr> The IP address of the device where the IP-MAC binding is made. <macaddr> The MAC address of the device where the IP-MAC binding is made. <vlan_name> The VLAN name of the VLAN that is bound to a MAC address in order to block a specific device on a known VLAN.
Restrictions	None.

Example usage:

To show IP-MAC Binding on the Switch:

```
DGS-3400:4#show address_binding ip_mac ipaddress 10.1.1.8 mac_address
00-00-00-00-00-12
Command: show address_binding ip_mac ipaddress 10.1.1.8 mac_address
00-00-00-00-00-12

ACL_mode : Enabled
Trap/Log  : Disabled
Enabled ports: 1:1-1:2
```

IP Address	MAC Address	Status	Mode	Ports
10.1.1.8	00-00-00-00-00-12	Inactive	ARP	1:1-1:24

```
Total entries : 1

DGS-3400:4#
```

delete address_binding

Purpose	Used to delete IP-MAC Binding entries.
Syntax	delete address_binding [ip_mac [ipaddress <ipaddr> {mac_address <macaddr>} all] blocked [all vlan_name <vlan_name> mac_address <macaddr>]]
Description	This command will delete IP-MAC Binding entries. Two different kinds of information can be deleted. • <i>ip_mac</i> –Individual Address Binding entries can be deleted by entering the physical and IP addresses of the device. Toggling to <i>all</i> will delete all the Address Binding entries. • <i>blocked</i> – Blocked address binding entries (bindings between

delete address_binding

VLAN names and MAC addresses) can be deleted by entering the VLAN name and the physical address of the device. To delete all the Blocked Address Binding entries, toggle *all*.

Parameters	<i><ipaddr></i> The IP address of the device where the IP-MAC binding is made. <i><macaddr></i> The MAC address of the device where the IP-MAC binding is made. <i><vlan_name></i> The VLAN name of the VLAN that is bound to a MAC address in order to block a specific device on a known VLAN. <i>all</i> – For IP_MAC binding <i>all</i> specifies all the IP-MAC binding entries; for Blocked Address Binding entries <i>all</i> specifies all the blocked VLANs and their bound physical addresses.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete an IP-MAC Binding on the switch:

```
DGS-3400:4#delete address-binding ip-mac ipaddress
10.1.1.1 mac_address 00-00-00-00-00-06
Command: delete address-binding ip-mac ipaddress
10.1.1.1 mac_address 00-00-00-00-00-06

Success.

DGS-3400:4#
```

enable address_binding acl_mode

Purpose	Used to enable the ACL mode for an IP-MAC binding entry.
Syntax	enable address_binding acl_mode
Description	This command, along with the disable address_binding acl_mode will enable and disable the ACL mode for IP-MAC binding on the Switch, without altering previously set configurations. When enabled, the Switch will automatically create two ACL packet content mask entries that can be viewed using the show access_profile command. These two ACL entries will aid the user in processing certain IP-MAC binding entries created.
Parameters	None.
Restrictions	Only administrator-level users can issue this command. The ACL entries created when this command is enabled, can only be automatically installed if the Access Profile table has two entries available of the possible 9 entries allowed. These access profile entries can only be deleted using the disable address_binding acl_mode and not through the delete access_profile profile_id command. Also, the show config command will not display the commands for creating the IP-MAC ACL mode access profile entries.

Example usage:

To enable IP-MAC Binding ACL mode on the Switch:

```
DGS-3400:4#enable address_binding acl_mode
Command: enable address_binding acl_mode

Success.

DGS-3400:4#
```

disable address_binding acl_mode

Purpose	Used to disable the ACL mode for an IP-MAC binding entry.
Syntax	disable address_binding acl_mode
Description	This command, along with the enable address_binding acl_mode will enable and disable the ACL mode for IP-MAC binding on the Switch, without altering previously set configurations. When disabled, the Switch will automatically delete two previously created ACL packet content mask entries that can be viewed using the show access_profile command.
Parameters	None.
Restrictions	Only administrator-level users can issue this command. The ACL entries created when this command is enabled, can only be automatically installed if the Access Profile table has two entries available of the possible 9 entries allowed. These access profile entries can only be deleted using the disable address_binding acl_mode and NOT though the delete access_profile profile_id command. Also, the show config command will not display the commands for creating the IP-MAC ACL mode access profile entries.

Example usage:

To disable IP-MAC Binding ACL mode on the Switch:

```
DGS-3400:4#disable address_binding acl_mode
Command: disable address_binding acl_mode

Success.

DGS-3400:4#
```

enable address_binding trap_log

Purpose	Used to enable the trap log for the IP-MAC binding function.
Syntax	enable address_binding trap_log
Description	This command, along with the disable address_binding trap_log will enable and disable the sending of trap log messages for IP-MAC binding. When enabled, the Switch will send a trap log message to the SNMP agent and the Switch log when an ARP packet is received that doesn't match the IP-MAC binding configuration set on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable sending of IP-MAC Binding trap log messages on the Switch:

```
DGS-3400:4#enable address_binding trap_log
Command: enable address_binding trap_log

Success.

DGS-3400:4#
```

disable address_binding trap_log

Purpose	Used to disable the trap log for the IP-MAC binding function.
Syntax	disable address_binding trap_log
Description	This command, along with the enable address_binding trap_log will enable and disable the sending of trap log messages for IP-MAC binding. When enabled, the Switch will send a trap log message to the SNMP agent and the Switch log when an ARP packet is received that doesn't match the IP-MAC binding configuration set on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable sending of IP-MAC Binding trap log messages on the Switch:

```
DGS-3400:4#disable address_binding trap_log
Command: disable address_binding trap_log

Success.

DGS-3400:4#
```

IP COMMANDS (INCLUDING IPv6)

The IP interface commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create ipif	<ipif_name 12> {<network_address>} <vlan_name 32> {state [enable disable]}
config ipif	<ipif_name 12> [{ipaddress <network_address> vlan <vlan_name 32> state [enable disable]} bootp dhcp ipv6 ipv6address <ipv6networkaddr>]
enable ipif	{<ipif_name 12> all}
disable ipif	{<ipif_name 12> all}
delete ipif	[<ipif_name 12> {ipv6address <ipv6networkaddr>} all]
show ipif	{<ipif_name 12>}
enable autoconfig*	

*See Switch Utility Commands for descriptions of all autoconfig commands.

Each command is listed, in detail, in the following sections.

create ipif	
Purpose	Used to create an IP interface on the Switch.
Syntax	create ipif <ipif_name 12> {<network_address>} <vlan_name 32> {state [enable disable]}
Description	This command will create an IP interface.
Parameters	<i><ipif_name 12></i> – The name for the IP interface to be created. The user may enter an alphanumeric string of up to 12 characters to define the IP interface. <i><network_address></i> – IP address and netmask of the IP interface to be created. The address and mask information can be specified using the traditional format (for example, 10.1.2.3/255.0.0.0 or in CIDR format, 10.1.2.3/8). <i><vlan_name 32></i> – The name of the VLAN that will be associated with the above IP interface. <i>state [enable disable]</i> – Allows the user to enable or disable the IP interface.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create the IP interface, p1 on VLAN Trinity:

```
DGS-3400:4#create ipif p1 10.1.1.1/8 Trinity state enable
Command: create ipif p1 10.1.1.1/8 Trinity state enable

Success.

DGS-3400:4#
```

config ipif

Purpose	Used to configure the System IP interface.
Syntax	config ipif <ipif_name 12> [{ipaddress <network_address> vlan <vlan_name 32> state [enable disable]} bootp dhcp ipv6 ipv6address <ipv6networkaddr>]
Description	This command is used to configure an IP interface on the Switch. Users may add one IPv4 address per interface but multiple IPv6 addresses may be added to a single interface. The format of IPv6 address resembles xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx where a set of xxxx represents a 16-bit hexadecimal value (ex. 2D83:0C76:3140:0000:0000:020C:417A:3214).
Parameters	<ipif_name 12> - Enter an alphanumeric string of up to 12 characters to identify this IP interface. ipaddress <network_address> – IP address and netmask of the IP interface to be created. Users can specify the address and mask information using the traditional format (for example, 10.1.2.3/255.0.0.0 or in CIDR format, 10.1.2.3/8). Only one IPv4 address can be configured per interface. <vlan_name 32> – The name of the VLAN corresponding to the IP interface. state [enable disable] – Allows users to enable or disable the IP interface. bootp – Allows the selection of the BOOTP protocol for the assignment of an IP address to the Switch's System IP interface. This method is only for IPv4 addresses and if users manually configure an IPv4 address and set this parameter, the manually set IP address will be overwritten by this protocol. dhcp – Allows the selection of the DHCP protocol for the assignment of an IP address to the Switch's System IP interface. If you are using the autoconfig feature, the Switch becomes a DHCP client automatically so it is not necessary to change the ipif settings. This method is only for IPv4 addresses and if users manually configure an IPv4 address and set this parameter, the manually set IP address will be overwritten by this protocol. <ipv6networkaddr> - Use this parameter to statically assign an IPv6 address to this interface. This address should define a host address and a network prefix length. Multiple IPv6 addresses can be configured for a single IP interface. Ex: 3ffe:501:ffff:100::1/64. The /64 represents the prefix length of the IPv6 addresses.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the IPv4 interface System:

```
DGS-3400:4#config ipif System ipaddress 10.48.74.122/8
Command: config ipif System ipaddress 10.48.74.122/8

Success.

DGS-3400:4#
```

Example usage:

To configure the IPv6 address for IP interface Trinity:

```
DGS-3400:4#config ipif Trinity ipv6 ipv6address 3ffe:501:ffff:100::1/64
Command: config ipif Trinity ipv6 ipv6address 3ffe:501:ffff:100::1/64

Success.

DGS-3400:4#
```

show ipif

Purpose	Used to display the configuration of an IP interface on the Switch.
Syntax	show ipif {<ipif_name 12>}
Description	This command will display the configuration of an IP interface on the Switch.
Parameters	<ipif_name 12> – The name created for the IP interface which will be viewed.
Restrictions	None.

Example usage:

To display IP interface settings.

```
DGS-3400:4#show ipif System
Command: show ipif System

Interface Name      : System
VLAN Name           : default
Interface Admin State : Enabled
IPv4 Address        : 10.48.74.122/8 (MANUAL)
IPv6 Link-Local Address : FE80::217:9AFF:FEBA:72CB/128

Interface Name      : Triton
VLAN Name           : Trinity
Interface Admin State : Enabled
IPv4 Address        : 0.0.0.0/0 (MANUAL)
IPv6 Link-Local Address : FE80::217:9AFF:FEBA:72CB/128
IPv6 Global Unicast Address : 3FFE:501:FFFF:100::1/64

Total Entries : 2

DGS-3400:4#
```

enable ipif

Purpose	Used to enable an IP interface on the Switch.
Syntax	enable ipif {<ipif_name 12> all}
Description	This command will enable the IP interface function on the Switch.
Parameters	<ipif_name 12> – The name of a previously configured IP interface to enable. Enter an alphanumeric entry of up to twelve characters to define the IP interface. all – Entering this parameter will enable all the IP interfaces currently configured on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable the ipif function on the Switch:

```
DGS-3400:4#enable ipif s2
Command: enable ipif s2

Success.

DGS-3400:4#
```

disable ipif

Purpose	Used to disable the configuration of an IP interface on the Switch.
Syntax	disable ipif {<ipif_name 12> all}
Description	This command will disable an IP interface on the Switch, without altering its configuration values.
Parameters	<ipif_name 12> – The name previously created to define the IP interface. all – Entering this parameter will disable all the IP interfaces currently configured on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the IP interface named “s2”:

```
DGS-3400:4#disable ipif s2
Command: disable ipif s2

Success.

DGS-3400:4#
```

delete ipif

Purpose	Used to delete the configuration of an IP interface on the Switch.
Syntax	delete ipif {<ipif_name 12> all}
Description	This command will delete the configuration of an IP interface on the Switch.
Parameters	<ipif_name 12> – The name of the IP interface to delete. all – Entering this parameter will delete all the IP interfaces currently configured on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the IP interface named s2:

```
DGS-3400:4#delete ipif s2
Command: delete ipif s2

Success.

DGS-3400:4#
```

enable autoconfig

Purpose	Used to activate the autoconfiguration function for the Switch. This will load a configuration file for current use.
Syntax	enable autoconfig
Description	When autoconfig is enabled on the Switch, the DHCP reply will contain a configuration file and path name. It will then request the file from the TFTP server specified in the reply. When autoconfig is enabled, the ipif settings will automatically become DHCP client.
Parameters	None.
Restrictions	When autoconfig is enabled, the Switch becomes a DHCP client automatically (same as: config ipif System dhcp). The DHCP server must have the TFTP server IP address and configuration file name, and be configured to deliver this information in the data field of the DHCP reply packet. The TFTP server must be running and have the requested configuration file in its base directory when the request is received from the Switch. Consult the DHCP server and TFTP server software instructions for information on loading a configuration file.

Example usage:

To enable autoconfiguration on the Switch:

DGS-3400:4#enable autoconfig

Command: enable autoconfig

Success.

DGS-3400:4#

NOTE: More detailed information for this command and related commands can be found in the section titled Switch Utility Commands.

IPv6 NEIGHBOR DETECTION COMMANDS

The following commands are used to detect IPv6 neighbors of the switch and to keep a running database about these neighbor devices. The IPv6 Neighbor Detection commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create ipv6 neighbor_cache ipif	<ipif_name 12> <ipv6addr> <macaddr>
delete ipv6 neighbor_cache	[<ipv6addr> static all]
show ipv6 neighbor_cache	{ipif <ipif_name 12> ipv6address <ipv6addr> static}
config ipv6 nd ra ipif	<ipif_name 12> {state [enable disable] life_time <value 0-9000> reachable_time <value 0-3600000> retrans_time <uint 0-4294967295> hop_limit <value 0-255> managed_flag [enable disable] other_config_flag [enable disable] min_rtr_adv_interval <value 3-1350> max_rtr_adv_interval <value 4-1800>}
config ipv6 nd ra prefix_option ipif	<ipif_name 12> <ipv6networkaddr> {preferred_life_time <uint 0-4294967295> valid_life_time <value 0-4294967295> on_link_flag [enable disable] autonomus_flag [enable disable]}
config ipv6 nd ns ipif	<ipif_name 12> retrans_time <uint 0-4294967295>
show ipv6 nd	{ipif <ipif_name 12>}

Each command is listed, in detail, in the following sections.

create ipv6 neighbor_cache ipif

Purpose	Used to add a static IPv6 neighbor.
Syntax	create ipv6 neighbor_cache ipif <ipif_name 12> <ipv6addr> <macaddr>
Description	This command is used to add a static IPv6 neighbor to an existing IPv6 interface previously created on the switch.
Parameters	<ipif_name 12> - Enter the IPv6 interface name previously created using the create ipif and config ipif commands. <ipv6addr> - Enter the IPv6 address of the neighbor device to be added as an IPv6 neighbor of the IP interface previously entered in this command. <macaddr> - Enter the MAC address of the neighbor device to be added as an IPv6 neighbor of the IP interface previously entered in this command.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create a static IPv6 neighbor:

```
DGS-3400:4#create ipv6 neighbor_cache ipif Triton 3FFC::1 00:01:02:03:04:05
Command: create ipv6 neighbor_cache ipif Triton 3FFC::1 00:01:02:03:04:05

Success.

DGS-3400:4#
```

delete ipv6 neighbor_cache

Purpose	Used to remove a static IPv6 neighbor.
Syntax	delete ipv6 neighbor_cache [<ipv6addr> static all]
Description	This command is used to remove a static IPv6 neighbor from an existing IPv6 interface previously created on the switch.
Parameters	<i><ipv6addr></i> - Enter the IPv6 address of the neighbor device to be removed from being an IPv6 neighbor of the IP interface previously entered in this command. <i>static</i> - Enter this command to remove all statically configured neighbor devices from being an IPv6 neighbor of the IP interface previously entered. <i>all</i> - Enter this parameter to remove all IPv6 neighbors of the switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a static IPv6 neighbor:

```
DGS-3400:4# delete ipv6 neighbor_cache 3FFC::1
Command: delete ipv6 neighbor_cache 3FFC::1

Success.

DGS-3400:4#
```

show ipv6 neighbor_cache

Purpose	Used to view the neighbor cache of an IPv6 interface located on the Switch.
Syntax	show ipv6 neighbor_cache {ipif <ipif_name 12> ipv6address <ipv6addr> static}
Description	This command is used to display the IPv6 neighbors of a configured IPv6 interface currently set on the switch. Users may specify an IP interface, IPv6 address or statically entered IPv6 addresses by which to view the neighbor cache.
Parameters	<i><ipif_name 12></i> - Enter the IP interface for which to view IPv6 neighbors. This will display all IPv6 neighbors of this interface. <i>ipv6address <ipv6addr></i> - Enter the IPv6 address of the neighbor by which to view this information. <i>static</i> - Enter this parameter to view all statically entered IPv6 neighbors of the switch.
Restrictions	None.

Example usage:

To display the IPv6 neighbors of a configured IP interface:

```
DGS-3400:4# show ipv6 neighbor_cache ipif Triton
Command: show ipv6 neighbor_cache ipif Triton

Neighbor          Linklayer Address  Interface  State
FE80::20B:6AFF:FECF:7EC6  00:0B:6A:CF:7E:C6  Triton     R

Total Entries : 1

State:
(I) means Incomplete State      (R) means Reachable State
(S) means State State           (D) means Delay State
(P) means Probe State           (T) means Static State

DGS-3400:4#
```

config ipv6 nd ra ipif

Purpose	Used to configure the parameters for router advertisement packets being sent from the switch.
Syntax	config ipv6 nd ra ipif <ipif_name 12> {state [enable disable] life_time <value 0-9000> reachable_time <value 0-3600000> retrans_time <uint 0-4294967295> hop_limit <value 0-255> managed_flag [enable disable] other_config_flag [enable disable] min_rtr_adv_interval <value 3-1350> max_rtr_adv_interval <value 4-1800>}
Description	This command is used to configure the settings for router advertisement packets being sent from the switch.
Parameters	<ipif_name 12> - Enter the IPv6 interface name that will be dispatching these router advertisements. state {enable disable} – Use this parameter to enable or disable the sending of router advertisement packets from the IPv6 interface name previously stated. life_time <value 0-9000> - This time represents the validity of this IPv6 interface to be the default router for the link-local network. A value of 0 represents that this Switch should not be recognized as the default router for this link-local network. The user may set a time between 0 and 9000 seconds with a default setting of 1800 seconds. reachable_time <value 0-3600000> - This field will set the time that remote IPv6 nodes are considered reachable. In essence, this is the Neighbor Unreachability Detection field once confirmation of the access to this node has been made. The user may set a time between 0 and 3600000 milliseconds with a default setting of 1200000 milliseconds. A very low value is not recommended. retrans_time <uint 0-4294967295> - Used to set an interval time between 0 and 4294967295 milliseconds for the dispatch of router advertisements by this interface over the link-local network, in response to a Neighbor Solicitation message. If this Switch is set as the default router for this local link, this value should not exceed the value stated in the Life Time field previously mentioned. Setting this field to zero will specify that this switch will not specify the Retransmit Time for the link-local network. (and therefore will be specified by another router on the link-local network. The default value is 0 milliseconds. hop_limit <value 0-255> - This field sets the number of nodes that this Router Advertisement packet will pass before being dropped. This number is set to depreciate by one after every node it reaches and will be dropped once the Hop Limit reaches 0. The user may set the Hop Limit between 0 and 255 with a default value of 64. managed_flag [enable disable] – Used to enable or disable the Managed flag. When enabled, this will trigger the router to use a stateful autoconfiguration

config ipv6 nd ra ipif

process to get both Global and link-local IPv6 addresses for the Switch. The default setting is *Disabled*.

other_config_flag [enable | disable] – Used to enable or disable the alternate configuration flag. When enabled, this will trigger the router to use a stateful autoconfiguration process to get configuration information that is not address information, yet is important to the IPv6 settings of the Switch. The default setting is *Disabled*.

min_rtr_adv_interval <value 3-1350> - Used to set the minimum interval time between the dispatch of router advertisements by this interface over the link-local network. This entry must be no less than 3 seconds and no more than .75 (3/4) of the MaxRtrAdvInterval. The user may configure a time between 3 and 1350 seconds with a default setting of 198 seconds.

max_rtr_adv_interval <value 4-1800> - Used to set the maximum interval time between the dispatch of router advertisements by this interface over the link-local network. This entry must be no less than 4 seconds (4000 milliseconds) and no more than 1800 seconds. The user may configure a time between 4 and 1800 seconds with a default setting of 600 seconds.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure the parameters for the Router Advertisements:

```
DGS-3400:4#config ipv6 nd ra ipif triton state enable life_time 1000
reachable_time 10000 retrans_time 50000 hop_limit 10 managed_flag enable
other_config_flag enable min_rtr_adv_interval 50 max_rtr_adv_interval 100
Command: config ipv6 nd ra ipif triton state enable life_time 1000 reachable_time
10000 retrans_time 50000 hop_limit 10 managed_flag enable other_config_flag
enable min_rtr_adv_interval 50 max_rtr_adv_interval 100
```

Success.

```
DGS-3400:4#
```

config ipv6 nd ra prefix_option ipif

Purpose	Used to configure the parameters for the prefix option of the router advertisements.
Syntax	config ipv6 nd ra prefix_option ipif <ipif_name 12> <ipv6networkaddr> {preferred_life_time <uint 0-4294967295> valid_life_time <value 0-4294967295> on_link_flag [enable disable] autonomus_flag [enable disable]}
Description	This command will configure the parameters for the prefix option located in the router advertisements. Users may set a prefix for Global Unicast IPv6 addresses to be assigned to other nodes on the link-local network. This prefix is carried in the Router Advertisement message to be shared on the link-local network. The user must first have a Global Unicast Address set for the Switch.
Parameters	<i><ipif_name 12></i> - Enter the IPv6 interface name that will be dispatching these router advertisements. <i><ipv6networkaddr></i> - Enter the IPv6 prefix for Global Unicast IPv6 addresses to be assigned to other nodes on the link-local network. This prefix is carried in the Router Advertisement message to be shared on the link-local network. The user must first have a Global Unicast Address set for the Switch. <i>preferred_life_time <uint 0-4294967295></i> - This field states the time that this prefix is advertised as being preferred on the link local network, when using stateless address configuration. The user may configure a time between 0 and 4294967295 milliseconds, with a default setting of 604800 milliseconds.

config ipv6 nd ra prefix_option ipif

valid_life_time <value 0-4294967295> - This field states the time that this prefix is advertised as valid on the link local network, when using stateless address configuration. The user may configure a time between 0 and 4294967295 milliseconds.

on_link_flag [enable | disable] - Setting this field to *enable* will denote, within the IPv6 packet, that the IPv6 prefix configured here is assigned to this link-local network. Once traffic has been successfully sent to these nodes with this specific IPv6 prefix, the nodes will be considered reachable on the link-local network.

autonomus_flag [enable | disable] - Setting this field to *enable* will denote that this prefix may be used to autoconfigure IPv6 addresses on the link-local network.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure the prefix option for the interface “Triton”:

```
DGS-3400:4#config ipv6 nd ra prefix_option ipif Triton 3FFE:501:FFFF:100::/64
preferred_life_time 1000 valid_life_time 1000 on_link_flag enable autonomous_flag enable
Command: config ipv6 nd ra prefix_option ipif Triton 3FFE:501:FFFF:100::/64
preferred_life_time 1000 valid_life_time 1000 on_link_flag enable autonomous_flag enable
```

Success.

DGS-3400:4#

config ipv6 nd ns ipif

Purpose Used to configure the parameters for Neighbor solicitation messages to be sent from the switch.

Syntax **config ipv6 nd ns ipif <ipif_name 12> retrans_time <uint 0-4294967295>**

Description This command will configure the parameters for Neighbor Solicitation messages sent from the switch. These messages are used to detect IPv6 neighbors of the switch.

Parameters *<ipif_name 12>* - Enter the IPv6 interface name for which to dispatch Neighbor solicitation messages.
retrans_time <uint 0-4294967295> - Use this field to set the interval, in seconds that this Switch will produce Neighbor Solicitation packets to be sent out over the local network. This is used to discover IPv6 neighbors on the local link. The user may select a time between 0 and 4294967295 milliseconds. Very fast intervals, represented by a low number, are not recommended for this field.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure The IPv6 ND Neighbor Solicitation messages:

```
DGS-3400:4# config ipv6 nd ns ipif Triton retrans_time 1000000
Command: config ipv6 nd ns ipif Triton retrans_time 1000000
```

Success.

DGS-3400:4#

show ipv6 nd

Purpose	Used to display information regarding Neighbor Detection on the switch.
Syntax	show ipv6 nd {ipif <ipif_name 12>}
Description	This command is used to show information regarding the IPv6 Neighbor Detection function of the switch. Users may specify an IP interface for which to view this information.
Parameters	<i>ipif <ipif_name 12></i> - Enter the IP interface of the IPv6 interface for which to view this information. Omitting this parameter will display all information regarding neighbor detection currently set on the switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the neighbor detection parameters for IPv6:

```
DGS-3400:4#show ipv6 nd
Command: show ipv6 nd

IGMP SNOOPING COMMANDS

The IGMP Snooping commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config igmp_snooping	[vlan <vlan_name 32> all] {host_timeout <sec 1-16711450> router_timeout <sec 1-16711450> leave_timer <sec 1-16711450> state [enable disable] fast_leave [enable disable]}
config igmp_snooping querier	[vlan <vlan_name 32> all] {query_interval <sec 1-65535> max_response_time <sec 1-25> robustness_variable <value 1-255> last_member_query_interval <sec 1-25> state [enable disable]}
config router_ports	<vlan_name 32> [add delete] <portlist>
config router_ports_forbidden	< vlan_name 32> [add delete] <portlist>
enable igmp_snooping	{forward_mcrouter_only}
show igmp_snooping	{vlan <vlan_name 32>}
disable igmp_snooping	{forward_mcrouter_only}
show igmp snooping group	vlan <vlan_name 32>
show router_ports	{vlan <vlan_name 32>} [{static dynamic forbidden}]

Each command is listed, in detail, in the following sections.

config igmp_snooping

Purpose	Used to configure IGMP snooping on the Switch.
Syntax	config igmp_snooping [vlan <vlan_name 32> all] {host_timeout <sec 1-16711450> router_timeout <sec 1-16711450> leave_timer <sec 1-16711450> state [enable disable] fast_leave [enable disable]}
Description	This command allows users to configure IGMP snooping on the Switch.
Parameters	<i>vlan <vlan_name 32></i> – The name of the VLAN for which IGMP snooping is to be configured. <i>host_timeout <sec 1-16711450></i> – Specifies the maximum amount of time a host can be a member of a multicast group without the Switch receiving a host membership report. The default is 260 seconds. <i>router_timeout <sec 1-16711450></i> – Specifies the maximum amount of time a route can be a member of a multicast group without the Switch receiving a host membership report. The default is 260 seconds. <i>leave_timer <sec 1-16711450></i> – Specifies the amount of time a Multicast address will stay in the database before it is deleted, after it has sent out a leave group message. The default is 2 seconds. <i>state [enable disable]</i> – Allows users to enable or disable IGMP snooping for the specified VLAN. <i>fast_leave [enable disable]</i> – This parameter allows the user to enable the <i>fast leave</i> function. Enabled, this function will allow members of a multicast group to leave the group immediately (without the implementation of the Last Member Query Timer) when an IGMP Leave Report Packet is received by the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure IGMP snooping:

DGS-3400:4# config igmp_snooping vlan default host_timeout 250 state enable

Command: config igmp_snooping vlan default host_timeout 250 state enable

Success.

DGS-3400:4#

NOTE: The *Fast Leave* function in the **config igmp_snooping** command can only be implemented if IGMP is disabled for all IP interfaces on the Switch. Configuring this function when IGMP is enabled will produce the error message “*Cannot set Fast leave when IGMP is running*” and consequently will not be implemented.

config igmp_snooping querier

Purpose	This command configures IGMP snooping querier.
Syntax	config igmp_snooping querier [vlan <vlan_name 32> all] {query_interval <sec 1-65535> max_response_time <sec 1-25> robustness_variable <value 1-255> last_member_query_interval <sec 1-25> state [enable disable]}
Description	Used to configure the time in seconds between general query transmissions, the maximum time in seconds to wait for reports from members and the permitted packet loss that guarantees IGMP snooping.
Parameters	 vlan <vlan_name 32> – The name of the VLAN for which IGMP snooping querier is to be configured. query_interval <sec 1-65535> – Specifies the amount of time in seconds between general query transmissions. The default setting is 125 seconds. max_response_time <sec 1-25> – Specifies the maximum time in seconds to wait for reports from members. The default setting is 10 seconds. robustness_variable <value 1-255> – Provides fine-tuning to allow for expected packet loss on a subnet. The value of the robustness variable is used in calculating the following IGMP message intervals: - Group member interval—Amount of time that must pass before a multicast router decides there are no more members of a group on a network. This interval is calculated as follows: (robustness variable x query interval) + (1 x query response interval). - Other querier present interval—Amount of time that must pass before a multicast router decides that there is no longer another multicast router that is the querier. This interval is calculated as follows: (robustness variable x query interval) + (0.5 x query response interval). - Last member query count—Number of group-specific queries sent before the router assumes there are no local members of a group. The default number is the value of the robustness variable. - By default, the robustness variable is set to 2. You might want to increase this value if you expect a subnet to be lossy. Although 1 is specified as a valid entry, the robustness variable should not be one or problems may arise. last_member_query_interval <sec 1-25> – The maximum amount of time between group-specific query messages, including those sent in response to leave-group messages. Users may lower this interval to reduce the amount of time it takes a router to detect the loss of the last member of a group. state [enable disable] – Allows the Switch to be specified as an IGMP Querier or Non-querier.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure IGMP snooping:

```
DGS-3400:4#config igmp_snooping querier vlan default query_interval 125 state enable
Command: config igmp_snooping querier vlan default query_interval 125 state enable
```

Success.

```
DGS-3400:4#
```

config router_ports

Purpose	Used to configure ports as router ports.
Syntax	config router_ports <vlan_name 32> [add delete] <portlist>
Description	This command allows designation of a range of ports as being connected to multicast-enabled routers. This will ensure that all packets with such a router as its destination will reach the multicast-enabled router – regardless of protocol, etc.
Parameters	<vlan_name 32> – The name of the VLAN on which the router port resides. add / delete – Use these parameters to either add or delete router ports to the specified VLAN. <portlist> – Specifies a port or range of ports that will be configured as router ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To set up static router ports:

```
DGS-3400:4#config router_ports default add 1:1-1:10
Command: config router_ports default add 1:1-1:10
```

Success.

```
DGS-3400:4#
```

config router_ports_forbidden

Purpose	Used to configure ports as forbidden multicast router ports.
Syntax	config router_ports_forbidden <vlan_name 32> [add delete] <portlist>
Description	This command allows designation of a port or range of ports as being forbidden to multicast-enabled routers. This will ensure that multicast packets will not be forwarded to this port – regardless of protocol, etc.
Parameters	<vlan_name 32> – The name of the VLAN on which the router port resides.

config router_ports_forbidden

[add | delete] - Specifies whether to add or delete forbidden ports of the specified VLAN.

<portlist> – Specifies a range of ports that will be configured as forbidden router ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

Restrictions Only administrator-level users can issue this command.

Example usage:

To set up forbidden router ports:

```
DGS-3400:4#config router_ports_forbidden default add 1:2-1:10
Command: config router_ports_forbidden default add 1:2-1:10

Success.

DGS-3400:4#
```

enable igmp_snooping

Purpose	Used to enable IGMP snooping on the Switch.
Syntax	enable igmp_snooping {forward_mcrouter_only}
Description	This command allows users to enable IGMP snooping on the Switch. If <i>forward_mcrouter_only</i> is specified, the Switch will only forward all multicast traffic to the multicast router, only. Otherwise, the Switch forwards all multicast traffic to any IP router.
Parameters	<i>forward_mcrouter_only</i> – Specifies that the Switch should only forward all multicast traffic to a multicast-enabled router. Otherwise, the Switch will forward all multicast traffic to any IP router.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable IGMP snooping on the Switch:

```
DGS-3400:4#enable igmp_snooping
Command: enable igmp_snooping

Success.

DGS-3400:4#
```

disable igmp_snooping

Purpose	Used to enable IGMP snooping on the Switch.
Syntax	disable igmp_snooping {forward_mcrouter_only}
Description	This command disables IGMP snooping on the Switch. IGMP

disable igmp_snooping

	snooping can be disabled only if IP multicast routing is not being used. Disabling IGMP snooping allows all IGMP and IP multicast traffic to flood within a given IP interface.
Parameters	<i>forward_mcrouter_only</i> – Adding this parameter to this command will disable forwarding all multicast traffic to a multicast-enabled routers. The Switch will then forward all multicast traffic to any IP router. Entering this command without the parameter will disable igmp snooping on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable IGMP snooping on the Switch:

```
DGS-3400:4#disable igmp_snooping
Command: disable igmp_snooping
```

Success.

```
DGS-3400:4#
```

Example usage:

To disable forwarding all multicast traffic to a multicast-enabled router:

```
DGS-3400:4#disable igmp_snooping forward_mcrouter_only
Command: disable igmp_snooping forward_mcrouter_only
```

Success.

```
DGS-3400:4#
```

show igmp_snooping

Purpose	Used to show the current status of IGMP snooping on the Switch.
Syntax	show igmp_snooping {vlan <vlan_name 32>}
Description	This command will display the current IGMP snooping configuration on the Switch.
Parameters	<vlan_name 32> – The name of the VLAN for which to view the IGMP snooping configuration.
Restrictions	None.

Example usage:

To show IGMP snooping:

```

DGS-3400:4#show igmp_snooping
Command: show igmp_snooping

IGMP Snooping Global State : Enabled

DGS-3400:4#

```

show router_ports

Purpose	Used to display the currently configured router ports on the Switch.
Syntax	show router_ports [static dynamic forbidden]
Description	This command will display the router ports currently configured on the Switch.
Parameters	<i><vlan_name 32></i> – The name of the VLAN on which the router port resides. <i>static</i> – Displays router ports that have been statically configured. <i>dynamic</i> – Displays router ports that have been dynamically configured. <i>forbidden</i> – Displays ports that are forbidden from becoming router ports.
Restrictions	None.

Example usage:

To display the router ports.

```

DGS-3400:4#show router_ports
Command: show router_ports

VLAN Name      : default
Static router port :
Dynamic router port : 3:2
Forbidden router port :

DGS-3400:4#

```

show igmp_snooping group

Purpose	Used to display the current IGMP snooping configuration on the Switch.
Syntax	show igmp_snooping group {vlan <vlan_name 32>}
Description	This command will display the current IGMP Snooping Group configuration setup currently configured on the Switch.

show igmp_snooping group

Parameters	<vlan_name 32> – The name of the VLAN for which to view IGMP snooping group information.
Restrictions	None.

Example usage:

To view the current IGMP snooping group:

DGS-3400:4#show igmp_snooping group
Command: show igmp_snooping group

VLAN Name : default

Reports : 1
Port Member : 1:22, 1:24

Total Entries : 6

DGS-3400:4#

MLD SNOOPING COMMANDS

Multicast Listener Discovery (MLD) Snooping is an IPv6 function used similarly to IGMP snooping in IPv4. It is used to discover ports on a VLAN that are requesting multicast data. Instead of flooding all ports on a selected VLAN with multicast traffic, MLD snooping will only forward multicast data to ports that wish to receive this data through the use of queries and reports produced by the requesting ports and the source of the multicast traffic.

MLD snooping is accomplished through the examination of the layer 3 part of an MLD control packet transferred between end nodes and a MLD router. When the switch discovers that this route is requesting multicast traffic, it adds the port directly attached to it into the correct IPv6 multicast table, and begins the process of forwarding multicast traffic to that port. This entry in the multicast routing table records the port, the VLAN ID and the associated multicast IPv6 multicast group address and then considers this port to be a active listening port. The active listening ports are the only ones to receive multicast group data.

MLD Control Messages

Three types of messages are transferred between devices using MLD snooping. These three messages are all defined by three ICMPv6 packet headers, labeled 130, 131 and 132.

1. **Multicast Listener Query** – Similar to the IGMPv2 Host Membership Query for IPv4, and labeled as 130 in the ICMPv6 packet header, this message is sent by the router to ask if any link is requesting multicast data. There are two types of MLD query messages emitted by the router. The General Query is used to advertise all multicast addresses that are ready to send multicast data to all listening ports, and the Multicast Specific query, which advertises a specific multicast address that is also ready. These two types of messages are distinguished by a multicast destination address located in the IPv6 header and a multicast address in the Multicast Listener Query Message.
2. **Multicast Listener Report** – Comparable to the Host Membership Report in IGMPv2, and labeled as 131 in the ICMP packet header, this message is sent by the listening port to the Switch stating that it is interested in receiving multicast data from a multicast address in response to the Multicast Listener Query message.
3. **Multicast Listener Done** – Akin to the Leave Group Message in IGMPv2, and labeled as 132 in the ICMPv6 packet header, this message is sent by the multicast listening port stating that it is no longer interested in receiving multicast data from a specific multicast group address, therefore stating that it is “done” with the multicast data from this address. Once this message is received by the Switch, it will no longer forward multicast traffic from a specific multicast group address to this listening port.

The MLD Snooping commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable mld_snooping	{forward_mrouter_only}
disable mld_snooping	{forward_mrouter_only}
config mld_snooping	[vlan <vlan_name 32> all] {node_timeout <sec 1-16711450> router_timeout <sec 1-16711450> done_timer <sec 1-16711450> state [enable disable] fast_done [enable disable]}
config mld_snooping mrouter_ports	<vlan_name 32> [add delete] <portlist>
config mld_snooping mrouter_ports_forbidden	<vlan_name 32> [add delete] <portlist>
config mld_snooping querier	[vlan <vlan_name 32> all] {query_interval <sec 1-65535> max_response_time <sec 1-25> robustness_variable <value 1-255> last_listener_query_interval <sec 1-25> state [enable disable]}
show mld_snooping	{vlan <vlan_name 32>}
show mld_snooping group	{vlan <vlan_name 32>}
show mld_snooping mrouter_ports	{vlan <vlan_name 32>} {[static dynamic forbidden]}

Each command is listed, in detail, in the following sections.

enable mld_snooping

Purpose	Used to enable MLD snooping globally on the switch.
Syntax	enable mld_snooping {forward_mcrouter_only}
Description	This command, in conjunction with the disable mld_snooping will enable and disable MLD snooping globally on the Switch without affecting configurations.
Parameters	<i>forward_mcrouter_only</i> - Specifies that the Switch should only forward all multicast traffic to a multicast-enabled router. Otherwise, the Switch will forward all multicast traffic to any IP router.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable MLD snooping globally on the Switch:

```
DGS-3400:4#enable mld_snooping
Command: enable mld_snooping

Success.

DGS-3400:4#
```

disable mld_snooping

Purpose	Used to disable MLD snooping globally on the switch.
Syntax	disable mld_snooping {forward_mcrouter_only}
Description	This command, in conjunction with the enable mld_snooping will enable and disable MLD snooping globally on the switch without affecting configurations.
Parameters	<i>forward_mcrouter_only</i> – Specify to disable the Switch from forwarding all multicast traffic to a multicast-enabled router. Otherwise, the Switch will forward all multicast traffic to any IP router.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable MLD snooping globally on the Switch:

```
DGS-3400:4#disable mld_snooping
Command: disable mld_snooping

Success.

DGS-3400:4#
```

config mld_snooping

Purpose	Used to configure MLD snooping on the Switch.
Syntax	config igmp_snooping [vlan <vlan_name 32> all] {node_timeout <sec 1-16711450> router_timeout <sec 1-16711450> done_timer <sec 1-16711450> state [enable disable] fast_done [enable disable]}
Description	This command allows users to configure IGMP snooping on the Switch.
Parameters	<i>vlan <vlan_name 32></i> – The name of the VLAN for which MLD snooping is to be configured. <i>all</i> – Entering this parameter will configure MLD snooping for all VLANs on the

config mld_snooping

switch.

node_timeout <sec 1-16711450> – Specifies the link node timeout, in seconds. After this timer expires, this node will no longer be considered as listening node. The user may specify a time between 1 and 16711450 with a default setting of 260 seconds.

router_timeout <sec 1-16711450> – Specifies the maximum amount of time a router can remain in the Switch's routing table as a listening node of a multicast group without the Switch receiving a node listener report. The user may specify a time between 1 and 16711450 with a default setting of 260 seconds.

done_timer <sec 1-16711450> – Specifies the maximum amount of time a router can remain in the Switch after receiving a done message from the group without receiving a node listener report. The user may specify a time between 1 and 16711450 with a default setting of 2 seconds.

state [enable | disable] – Allows users to enable or disable MLD snooping for the specified VLAN.

fast_done [enable | disable] – This parameter allows the user to enable the *fast_done* function. Enabled, this function will allow members of a multicast group to leave the group immediately when a *done* message is received by the Switch.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure MLD snooping:

DGS-3400:4#config mld_snooping vlan default node_timeout 250 state enable
Command : config mld_snooping vlan default node_timeout 250 state enable

Success.

DGS-3400:4#

config mld_snooping mrouter_ports

Purpose	Used to configure ports as router ports on the Switch.
Syntax	config mld_snooping mrouter_ports <vlan_name 32> [add delete] <portlist>
Description	This command allows users to designate a range of ports as being connected to a multicast-enabled router. This command will ensure that all packets with this router as its destination will reach the multicast-enabled router.
Parameters	<i>vlan</i> <vlan_name 32> – The name of the VLAN on which the router port resides. <i>add delete</i> – Specify to add or delete ports as router ports. <i><portlist></i> - Specify a port or range of ports to be configured as router ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure MLD snooping multicast router ports:

```
DGS-3400:4#config mld_snooping mrouter_ports default add 1:1-1:10
Command : config mld_snooping mrouter_ports default add 1:1-1:10
```

Success.

```
DGS-3400:4#
```

config mld_snooping mrouter_ports_forbidden

Purpose	Used to configure ports on the Switch as forbidden router ports.
Syntax	config mld_snooping mrouter_ports_forbidden <vlan_name 32> [add delete] <portlist>
Description	This command allows users to designate a port or range of ports as being forbidden from being connected to multicast enabled routers. This ensures that these configured forbidden ports will not send out routing packets.
Parameters	<i>vlan</i> <vlan_name 32> – The name of the VLAN on which the router port will be forbidden. <i>add delete</i> – Specify to add or delete ports as forbidden router ports. <i><portlist></i> - Specify a port or range of ports to be configured as forbidden router ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure MLD snooping forbidden multicast router ports:

```
DGS-3400:4#config mld_snooping mrouter_ports_forbidden default add 1:11-1:20
Command : config mld_snooping mrouter_ports_forbidden default add 1:11-1:20
```

Success

```
DGS-3400:4#
```

config mld_snooping querier

Purpose	Used to configure the timers and settings for the MLD snooping querier for the Switch.
Syntax	config mld_snooping querier [vlan <vlan_name 32> all] {query_interval <sec 1-65535> max_response_time <sec 1-25> robustness_variable <value 1-255> last_listener_query_interval <sec 1-25> state [enable disable]}
Description	This command allows users to configure the time between general query transmissions, the maximum time to wait for reports from listeners and the permitted packet loss guaranteed by MLD snooping.
Parameters	<i>vlan</i> <vlan_name 32> – The name of the VLAN for which to configure the MLD querier. <i>all</i> – Specifies all VLANs are to be configured for the MLD querier. <i>query_interval</i> <sec 1-65535> - Specifies the amount of time between general query transmissions. The user may specify a time between 1 and 65535 seconds with a default setting of 125 seconds.

config mld_snooping querier

max_response_time <sec 1-25> - The maximum time to wait for reports from listeners. The user may specify a time between 1 and 25 seconds with a default setting of 10 seconds.

robustness_variable <value 1-255> - Provides fine-tuning to allow for expected packet loss on a subnet. The user may choose a value between 1 and 255 with a default setting of 2. If a subnet is expected to be lossy, the user may wish to increase this interval.

last_listener_query_interval <sec 1-25> - The maximum amount of time to be set between group-specific query messages. This interval may be reduced to lower the amount of time it takes a router to detect the loss of a last listener group. The user may set this interval between 1 and 25 seconds with a default setting of 1 second.

state [enable | disable] – Enabling the querier state will set the Switch as a MLD querier and disabling it will set it as a Non-querier. The default setting is disabled.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure the MLD snooping querier:

```
DGS-3400:4#config mld_snooping querier vlan default query_interval 125 state enable
Command : config mld_snooping querier vlan default query_interval 125 state enable
```

Success.

```
DGS-3400:4#
```

NOTE: The robustness variable of the MLD snooping querier is used in creating the following MLD message intervals:

Group Listener Interval – This is the amount of time that must pass before a multicast router decides that there are no more listeners present of a group on a network. Calculated as (robustness variable * query interval) + (1 * query interval).

Querier Present Interval - This is the amount of time that must pass before a multicast router decides that there are no other querier devices present. Calculated as (robustness variable * query interval) + (0.5 * query response interval).

Last Listener Query Count – This is the amount of group-specific queries sent before the router assumes there are no local listeners in this group. The default value is the value of the robustness variable.

show mld_snooping

Purpose	Used to display the current status of the MLD snooping function on the Switch.
Syntax	show mld_snooping {vlan<vlan_name 32>}
Description	This command allows users to display the current status of the MLD snooping function on the Switch.
Parameters	vlan <vlan_name 32> – The name of the VLAN for which to view the MLD snooping configurations. If no parameter is specified, the Switch will display all current MLD snooping configurations.
Restrictions	None.

Example usage:

To display the MLD snooping settings

```

DGS-3400:4#show mld_snooping
Command: show mld_snooping

show mld_snooping mrouter_ports

Purpose	Used to display the current router ports set on the Switch.
Syntax	show mld_snooping group {vlan <vlan_name 32> {[static dynamic forbidden]}}
Description	This command display the current router ports set on the Switch.
Parameters	<i>vlan <vlan_name 32></i> – The name of the VLAN on which the router port resides. <i>static</i> – Displays router ports that have been statically configured. <i>dynamic</i> – Displays router ports that have been dynamically configured. <i>forbidden</i> – Displays router ports that have been configured as forbidden. If no parameter is specified, the Switch will display all currently configured router ports on the Switch.
Restrictions	None.

Example usage:

To display the MLD snooping multicast router port settings:

DGS-3400:4#show mld_snooping mrouter_ports

Commands: show mld_snooping mrouter_ports

LIMITED IP MULTICAST ADDRESS

The **Limited IP Multicast Address** commands allow users to specify which multicast address(es) reports are to be received on specified ports on the switch. This function will therefore limit the number of reports received and the number of multicast groups configured on the switch. The user may set an IP address or range of IP addresses to accept reports (Permit) or deny reports (Deny) coming into the specified switch ports. The **Limited IP Multicast Address** Commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config limited multicast address	<portlist> {from <multicast_ipaddr> to <multicast_ipaddr> access [permit deny] state [enable disable]}
delete limited multicast address	[all <portlist>]
show limited multicast address	{<portlist>}

Each command is listed, in detail, in the following sections.

config limited multicast address

Purpose	Used to configure limited IP multicast address range.
Syntax	config limited multicast address <portlist> {from <multicast_ipaddr> to <multicast_ipaddr> access [permit deny] state [enable disable]}
Description	The config limited multicast address command allows the user to configure the multicast address range, access level, and state.
Parameters	<portlist> - A port or range of ports to config the limited multicast address. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) from <multicast_ipaddr> - Enter the lowest multicast IP address of the range. to <multicast_ipaddr> - Enter the highest multicast IP address of the range. access - Choose either <i>permit</i> or <i>deny</i> to limit or grant access to a specified range of Multicast addresses on a particular port or range of ports. state - This parameter allows the user to <i>enable</i> or <i>disable</i> the limited multicast address range on a specific port or range of ports.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the limited multicast address on ports 1-3:

```
DGS-3400:4#config limited multicast address 1:1-1:3 from
224.1.1.1 to 224.1.1.2 access permit state enable
Command: config limited multicast address 1:1-1:3 from
224.1.1.1 to 224.1.1.2 access permit state enable
```

Success.

```
DGS-3400:4#
```

delete limited multicast address

Purpose	Used to delete Limited IP multicast address range.
Syntax	delete limited multicast address [all <portlist>]
Description	The delete limited multicast address command allows the user to delete all multicast address ranges or a selected range based on which port or ports the range has been assigned.
Parameters	<i>all</i> - Allows the user to delete all limited multicast addresses that have been configured on the Switch. <i><portlist></i> - Allows the user to delete only those multicast address ranges that have been assigned to a particular port or range of ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the limited multicast address on ports 1-3:

```
DGS-3400:4#delete limited multicast address 1:1-1:3
Command: delete limited multicast address 1:1-1:3
```

Success.

```
DGS-3400:4#
```

show limited multicast address

Purpose	Used to show per-port Limited IP multicast address range.
Syntax	show limited multicast address {<portlist>}
Description	The show limited multicast address command allows the user to show multicast address range by ports.
Parameters	<i><portlist></i> - A port or range of ports on which the limited multicast address range to be shown has been assigned. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None.

Example usage:

To show the limited multicast address on ports 1-3 of module 1:

DGS-3400:4#show limited multicast address 1:1-1:3

Command: show limited multicast address 1:1-1:3

Port	From	To	Access	Status
----	-----	-----	-----	-----
1:1	224.1.1.1	224.1.1.2	permit	enable
1:2	224.1.1.1	224.1.1.2	permit	enable
1:3	224.1.1.1	224.1.1.2	permit	enable

DGS-3400:4#

802.1X COMMANDS

The xStack DGS-3400 implements the server-side of the IEEE 802.1x Port-based and MAC-based Network Access Control. This mechanism is intended to allow only authorized users, or other network devices, access to network resources by establishing criteria for each port on the Switch that a user or network device must meet before allowing that port to forward or receive frames.

The 802.1X commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable 802.1x	
disable 802.1x	
show 802.1x auth_state	{ports <portlist>}
show 802.1x auth_configuration	{ports <portlist>}
config 802.1x auth_protocol	[local radius_eap]
create 802.1x user	<username 15>
delete 802.1x user	<username 15>
show 802.1x user	
show auth_statistics	{ports <portlist all>}
show auth_diagnostics	{ports <portlist all>}
show auth_session_statistics	{ports <portlist all>}
show auth_client	
show acct_client	
config 802.1x capability ports	[<portlist> all] [authenticator none]
config 802.1x auth_parameter ports	[<portlist> all] [default {direction [both in] port_control [force_unauth auto force_auth] quiet_period <sec 0-65535> tx_period <sec 1-65535> supp_timeout <sec 1-65535> server_timeout <sec 1-65535> max_req <value 1-10> reauth_period <sec 1-65535> enable_reauth [enable disable]}]
config 802.1x init	[port_based ports [<portlist> all] mac_based [ports] [<portlist> all] {mac_address <macaddr>}]
config 802.1x auth_mode	[port_based mac_based]
config 802.1x reauth	[port_based ports [<portlist> all] mac_based [ports] [<portlist> all] {mac_address <macaddr>}]
config radius add	<server_index 1-3> <server_ip> key <passwd 32> [default {auth_port <udp_port_number 1-65535> acct_port <udp_port_number 1-65535>}]
config radius delete	<server_index 1-3>
config radius	<server_index 1-3> {ipaddress <server_ip> key <passwd 32> [auth_port <udp_port_number 1-65535> acct_port <udp_port_number 1-65535>]}
show radius	

Command	Parameters
create 802.1x guest_vlan	<vlan_name 32>
config 802.1x guest_vlan ports	[<portlist> all] state [enable disable]
delete 802.1x guest_vlan	{<vlan_name 32>}
show 802.1x guest_vlan	

Each command is listed, in detail, in the following sections

enable 802.1x

Purpose	Used to enable the 802.1x server on the Switch.
Syntax	enable 802.1x
Description	The enable 802.1x command enables the 802.1x Network Access control server application on the Switch. To select between port-based or MAC-based, use the config 802.1x auth_mode command.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable 802.1x switch wide:

```
DGS-3400:4#enable 802.1x
Command: enable 802.1x

Success.

DGS-3400:4#
```

disable 802.1x

Purpose	Used to disable the 802.1x server on the Switch.
Syntax	disable 802.1x
Description	The disable 802.1x command is used to disable the 802.1x Network Access control server application on the Switch. To select between port-based or MAC-based, use the config 802.1x auth_mode command.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable 802.1x on the Switch:

```
DGS-3400:4#disable 802.1x
Command: disable 802.1x

Success.

DGS-3400:4#
```

show 802.1x auth_configuration

Purpose	Used to display the current configuration of the 802.1x server on the Switch.
Syntax	show 802.1x auth_configuration {ports <portlist>}
Description	The show 802.1x user command is used to display the 802.1x Port-based or MAC-based Network Access control local users currently configured on the Switch.
Parameters	ports <portlist> – Specifies a port or range of ports to view. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) The following details are displayed: 802.1x Enabled / Disabled – Shows the current status of 802.1x functions on the Switch. Authentication Mode – Shows the authentication mode, whether it be by MAC address or by port. Authentication Protocol: Radius_Eap/Local – Shows the authentication protocol suite in use between the Switch and a RADIUS server. Port number – Shows the physical port number on the Switch. Capability: Authenticator None – Shows the capability of 802.1x functions on the port number displayed above. There are two 802.1x capabilities that can be set on the Switch: Authenticator and None. AdminCtlDir: Both / In – Shows whether a controlled Port that is unauthorized will exert control over communication in both receiving and transmitting directions, or just the receiving direction. OpenCtlDir: Both / In – Shows whether a controlled Port that is unauthorized will exert control over communication in both receiving and transmitting directions, or just the receiving direction. Port Control: ForceAuth / ForceUnauth / Auto – Shows the administrative control over the port's authorization status. ForceAuth forces the Authenticator of the port to become Authorized. ForceUnauth forces the port to become Unauthorized. QuietPeriod – Shows the time interval between authentication failure and the start of a new authentication attempt. TxPeriod – Shows the time to wait for a response from a supplicant (user) to send EAP Request / Identity packets. SuppTimeout – Shows the time to wait for a response from a supplicant (user) for all EAP packets, except for the Request / Identity packets. ServerTimeout – Shows the length of time to wait for a response from a Radius server. MaxReq – Shows the maximum number of times to retry sending packets to the supplicant. ReAuthPeriod – Shows the time interval between successive re-authentications. ReAuthenticate: Enabled / Disabled – Shows whether or not to re-authenticate.
Restrictions	None.

Example usage:

To display the 802.1x authentication states:

DGS-3400:4#show 802.1x auth_configuration ports 1:1

Command: show 802.1x auth_configuration ports 1:1

802.1X : Enabled
 Authentication Mode : Port_based
 Authentication Protocol : Radius_Eap

Port number : 1:1
 Capability : None
 AdminCrIDir : Both
 OpenCrIDir : Both
 Port Control : Auto
 QuietPeriod : 60 sec
 TxPeriod : 30 sec
 SuppTimeout : 30 sec
 ServerTimeout : 30 sec
 MaxReq : 2 times
 ReAuthPeriod : 3600 sec
 ReAuthenticate : Disabled

CTRL+C ESC q Quit SPACE n Next Page Enter Next Entry a All

show 802.1x auth_state

Purpose	Used to display the current authentication state of the 802.1x server on the Switch.
Syntax	show 802.1x auth_state {ports <portlist>}
Description	The show 802.1x auth_state command is used to display the current authentication state of the 802.1x Port-based or MAC-based Network Access Control server application on the Switch.
Parameters	<i>ports <portlist></i> – Specifies a port or range of ports to be viewed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) The following details what is displayed: Port number – Shows the physical port number on the Switch. Auth PAE State: Initialize / Disconnected / Connecting / Authenticating / Authenticated / Held / ForceAuth / ForceUnauth – Shows the current state of the Authenticator PAE. Backend State: Request / Response / Fail / Idle / Initialize / Success / Timeout – Shows the current state of the Backend Authenticator. Port Status: Authorized / Unauthorized – Shows the result of the authentication process. Authorized means that the user was authenticated, and can access the network. Unauthorized means that the user was not authenticated, and cannot access the network.
Restrictions	None.

Example usage:

To display the 802.1x auth state for Port-based 802.1x:

DGS-3400:4#show 802.1x auth_state
Command: show 802.1x auth_state

Port	Auth PAE State	Backend State	Port Status
1:1	ForceAuth	Success	Authorized
1:2	ForceAuth	Success	Authorized
1:3	ForceAuth	Success	Authorized
1:4	ForceAuth	Success	Authorized
1:5	ForceAuth	Success	Authorized
1:6	ForceAuth	Success	Authorized
1:7	ForceAuth	Success	Authorized
1:8	ForceAuth	Success	Authorized
1:9	ForceAuth	Success	Authorized
1:10	ForceAuth	Success	Authorized
1:11	ForceAuth	Success	Authorized
1:12	ForceAuth	Success	Authorized
1:13	ForceAuth	Success	Authorized
1:14	ForceAuth	Success	Authorized
1:15	ForceAuth	Success	Authorized
1:16	ForceAuth	Success	Authorized
1:17	ForceAuth	Success	Authorized
1:18	ForceAuth	Success	Authorized
1:19	ForceAuth	Success	Authorized
1:20	ForceAuth	Success	Authorized

config 802.1x auth_mode

Purpose	Used to configure the 802.1x authentication mode on the Switch.
Syntax	config 802.1x auth_mode {port_based mac_based}
Description	The config 802.1x auth_mode command is used to enable either the port-based or MAC-based 802.1x authentication feature on the Switch.
Parameters	<i>[port_based mac_based]</i> – The Switch allows users to authenticate 802.1x by either port or MAC address.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure 802.1x authentication by MAC address:

```
DGS-3400:4#config 802.1x auth_mode mac_based
Command: config 802.1x auth_mode mac_based

Success.

DGS-3400:4#
```

config 802.1x capability ports

Purpose	Used to configure the 802.1x capability of a range of ports on the Switch.
Syntax	config 802.1x capability ports [<portlist> all] [authenticator none]
Description	The config 802.1x capability ports command has four capabilities that can be set for each port. Authenticator, Supplicant, Authenticator and Supplicant, and None.
Parameters	<i><portlist></i> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Specifies all of the ports on the Switch. <i>authenticator</i> – A user must pass the authentication process to gain access to the network. <i>none</i> – The port is not controlled by the 802.1x functions.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure 802.1x capability on ports 1-10 of module 1:

```
DGS-3400:4#config 802.1x capability ports 1:1 – 1:10 authenticator
Command: config 802.1x capability ports 1:1 – 1:10 authenticator

Success.

DGS-3400:4#
```

config 802.1x auth_parameter

Purpose	Used to configure the 802.1x Authentication parameters on a range of ports. The default parameter will return all ports in the specified range to their default 802.1x settings.
Syntax	config 802.1x auth_parameter ports [<portlist> all] [default {direction [both in] port_control [force_unauth auto force_auth] quiet_period <sec 0-65535> tx_period <sec 1-65535> supp_timeout <sec 1-65535> server_timeout <sec 1-65535> max_req <value 1-10> reauth_period <sec 1-65535> enable_reauth [enable disable]}]
Description	The config 802.1x auth_parameter command is used to configure the 802.1x Authentication parameters on a range of ports. The default parameter will return all ports in the specified range to their default 802.1x settings.
Parameters	<portlist> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specifies all of the ports on the Switch. default – Returns all of the ports in the specified range to their 802.1x default settings. direction [both in] – Determines whether a controlled port blocks communication in both the receiving and transmitting directions, or just the receiving direction. port_control – Configures the administrative control over the authentication process for the range of ports. The user has the following authentication options: • <i>force_auth</i> – Forces the Authenticator for the port to become authorized. Network access is allowed. • <i>auto</i> – Allows the port's status to reflect the outcome of the authentication process. • <i>force_unauth</i> – Forces the Authenticator for the port to become unauthorized. Network access will be blocked. quiet_period <sec 0-65535> – Configures the time interval between authentication failure and the start of a new authentication attempt. tx_period <sec 1-65535> - Configures the time to wait for a response from a supplicant (user) to send EAP Request/Identity packets. supp_timeout <sec 1-65535> - Configures the time to wait for a response from a supplicant (user) for all EAP packets, except for the Request/Identity packets. server_timeout <sec 1-65535> - Configure the length of time to wait for a response from a RADIUS server. max_req <value 1-10> – Configures the number of times to retry sending packets to a supplicant (user). reauth_period <sec 1-65535> – Configures the time interval between successive re-authentications. enable_reauth [enable disable] – Determines whether or not the Switch will re-authenticate. Enabled causes re-authentication of users at the time interval specified in the Re-authentication Period field, above.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure 802.1x authentication parameters for ports 1 – 20 on module 1:

```
DGS-3400:4#config 802.1x auth_parameter ports 1:1-1:20 direction both
Command: config 802.1x auth_parameter ports 1:1-1:20 direction both

Success.

DGS-3400:4#
```

config 802.1x init

Purpose	Used to initialize the 802.1x function on a range of ports.
Syntax	config 802.1x init {port_based ports [<portlist> all] mac_based [ports] [<portlist> all] {mac_address <macaddr>}}
Description	The config 802.1x init command is used to immediately initialize the 802.1x functions on a specified range of ports or for specified MAC addresses operating from a specified range of ports.
Parameters	<i>port_based</i> – This instructs the Switch to initialize 802.1x functions based only on the port number. Ports approved for initialization can then be specified. <i>mac_based</i> – This instructs the Switch to initialize 802.1x functions based only on the MAC address. MAC addresses approved for initialization can then be specified. <i>ports <portlist></i> – Specifies a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Specifies all of the ports on the Switch. <i>mac_address <macaddr></i> - Enter the MAC address to be initialized.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To initialize the authentication state machine of all ports:

```
DGS-3400:4# config 802.1x init port_based ports all
Command: config 802.1x init port_based ports all

Success.

DGS-3400:4#
```

config 802.1x reauth

Purpose	Used to configure the 802.1x re-authentication feature of the Switch.
Syntax	config 802.1x reauth {port_based ports [<portlist> all] mac_based [ports] [<portlist> all] {mac_address <macaddr>}}
Description	The config 802.1x reauth command is used to re-authenticate a previously authenticated device based on port number.
Parameters	<i>port_based</i> – This instructs the Switch to re-authorize 802.1x functions based only on the port number. Ports approved for re-authorization

config 802.1x reauth

can then be specified.

mac_based – This instructs the Switch to re-authorize 802.1x functions based only on the MAC address. MAC addresses approved for re-authorization can then be specified.

ports <portlist> – Specifies a port or range of ports to be re-authorized. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order.

all – Specifies all of the ports on the Switch.

mac_address <macaddr> - Enter the MAC address to be re-authorized.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure 802.1x reauthentication for ports 1:1-1:18:

DGS-3400:4#config 802.1x reauth port_based ports 1:1-1:18

Command: config 802.1x reauth port_based ports 1:1-1:18

Success.

DGS-3400:4#

config radius add

Purpose	Used to configure the settings the Switch will use to communicate with a RADIUS server.
Syntax	config radius add <server_index 1-3> <server_ip> key <passwd 32> [default {auth_port <udp_port_number 1-65535> acct_port <udp_port_number 1-65535>}]
Description	The config radius add command is used to configure the settings the Switch will use to communicate with a RADIUS server.
Parameters	<i><server_index 1-3></i> – Assigns a number to the current set of RADIUS server settings. Up to 3 groups of RADIUS server settings can be entered on the Switch. <i><server_ip></i> – The IP address of the RADIUS server. <i>key</i> – Specifies that a password and encryption key will be used between the Switch and the Radius server. <i><passwd 32></i> – The shared-secret key used by the RADIUS server and the Switch. Up to 32 characters can be used. <i>default</i> – Uses the default UDP port number in both the “auth_port” and “acct_port” settings. <i>auth_port <udp_port_number 1-65535></i> – The UDP port number for authentication requests. The default is 1812. <i>acct_port <udp_port_number 1-65535></i> – The UDP port number for accounting requests. The default is 1813.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the RADIUS server communication settings:

```
DGS-3400:4#config radius add 1 10.48.74.121 key dlink default
Command: config radius add 1 10.48.74.121 key dlink default

Success.

DGS-3400:4#
```

config radius delete

Purpose	Used to delete a previously entered RADIUS server configuration.
Syntax	config radius delete <server_index 1-3>
Description	The config radius delete command is used to delete a previously entered RADIUS server configuration.
Parameters	<server_index 1-3> – Assigns a number to the current set of RADIUS server settings. Up to three groups of RADIUS server settings can be entered on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete previously configured RADIUS server communication settings:

```
DGS-3400:4#config radius delete 1
Command: config radius delete 1

Success.

DGS-3400:4#
```

config radius

Purpose	Used to configure the Switch's RADIUS settings.
Syntax	config radius <server_index 1-3> {ipaddress <server_ip> key <passwd 32> auth_port <udp_port_number 1-65535> acct_port <udp_port_number 1-65535>}
Description	The config radius command is used to configure the Switch's RADIUS settings.
Parameters	<server_index 1-3> – Assigns a number to the current set of RADIUS server settings. Up to 3 groups of RADIUS server settings can be entered on the Switch. ipaddress <server_ip> – The IP address of the RADIUS server. key – Specifies that a password and encryption key will be used between the Switch and the RADIUS server. <passwd 32> – The shared-secret key used by the RADIUS server and the Switch. Up to 32 characters can be used. auth_port <udp_port_number 1-65535> – The UDP port number for authentication requests. The default is 1812. acct_port <udp_port_number 1-65535> – The UDP port number for accounting requests. The default is 1813.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the RADIUS settings:

```
DGS-3400:4#config radius 1 10.48.74.121 key dlink default
Command: config radius 1 10.48.74.121 key dlink default
```

Success.

```
DGS-3400:4#
```

show radius

Purpose	Used to display the current RADIUS configurations on the Switch.
Syntax	show radius
Description	The show radius command is used to display the current RADIUS configurations on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To display RADIUS settings on the Switch:

```
DGS-3400:4#show radius
```

Command: show radius

Idx	IP Address	Auth-Port No.	Acct-Port No.	Status	Key
1	10.1.1.1	1812	1813	Active	switch
2	20.1.1.1	1800	1813	Active	dgs3426
3	30.1.1.1	1812	1813	Active	dlink

Total Entries : 3

```
DGS-3400:4#
```

create 802.1x user

Purpose	Used to create a new 802.1x user.
Syntax	create 802.1x user <username 15>
Description	The create 802.1x user command is used to create new 802.1x users.
Parameters	<username 15> – A username of up to 15 alphanumeric characters in length.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create an 802.1x user:

```
DGS-3400:4#create 802.1x user dtremblett
Command: create 802.1x user dtremblett

Enter a case-sensitive new password:*****
Enter the new password again for confirmation:*****
Success.

DGS-3400:4#
```

show 802.1x user

Purpose	Used to display the 802.1x user accounts on the Switch.
Syntax	show 802.1x user
Description	The show 802.1x user command is used to display the 802.1x Port-based or MAC-based Network Access control local users currently configured on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To view 802.1X users currently configured on the Switch:

```
DGS-3400:4#show 802.1x user
Command: show 802.1x user

Current Accounts:
Username      Password
-----
Darren        Trinity

Total entries: 1

DGS-3400:4#
```

delete 802.1x user

Purpose	Used to delete an 802.1x user account on the Switch.
Syntax	delete 802.1x user <username 15>
Description	The delete 802.1x user command is used to delete the 802.1x Port-based or MAC-based Network Access control local users currently configured on the Switch.
Parameters	<username 15> – A username can be as many as 15 alphanumeric characters.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete 802.1x users:

```
DGS-3400:4# delete 802.1x user dtremblett
Command: delete 802.1x user dtremblett

Success.

DGS-3400:4#
```

config 802.1x auth_protocol

Purpose	Used to configure the 802.1x authentication protocol on the Switch.
Syntax	config 802.1x auth_protocol [local radius_eap]
Description	The config 802.1x auth_protocol command enables configuration of the authentication protocol.
Parameters	<i>[local radius_eap]</i> – Specify the type of authentication protocol desired.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the authentication protocol on the Switch:

```
DGS-3400:4# config 802.1x auth_protocol local
Command: config 802.1x auth_protocol local

Success.

DGS-3400:4#
```

show acct_client

Purpose	Used to display the current RADIUS accounting client.
Syntax	show acct_client
Description	The show acct_client command is used to display the current RADIUS accounting client currently configured on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To view the current RADIUS accounting client:

```
DGS-3400:4#show acct_client
Command: show acct_client

radiusAcctClient
-----
radiusAcctClientInvalidServerAddresses      0
radiusAcctClientIdentifier                  D-Link

show auth_client

Purpose	Used to display the current RADIUS authentication client.
Syntax	show auth_client
Description	The show auth_client command is used to display the current RADIUS authentication client currently configured on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To view the current RADIUS authentication client:

```
DGS-3400:4#show auth_client
Command: show auth_client

radiusAuthClient
-----
radiusAuthClientInvalidServerAddresses    0
radiusAuthClientIdentifier                D-Link

radiusAuthServerEntry                    0

show auth_diagnostics

Purpose	Used to display the current authentication diagnostics.
Syntax	show auth_diagnostics {ports [<portlist> all]}
Description	The show auth_diagnostics command is used to display the current authentication diagnostics of the Switch on a per port basis.
Parameters	<i>ports <portlist></i> – Specifies a range of ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Specifies that all ports will be viewed.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the current authentication diagnostics for port 16 of module 1:

```
DGS-3400:4#show auth_diagnostics ports 1:16
Command: show auth_diagnostics ports 1:16

Port number : 1:16

show auth_session_statistics

Purpose	Used to display the current authentication session statistics.
Syntax	show auth_session_statistics {ports <portlist all>}
Description	The show auth_session statistics command is used to display the current authentication session statistics of the Switch on a per port basis.
Parameters	<i>ports <portlist></i> – Specifies a range of ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Specifies that all ports will be viewed.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the current authentication session statistics for port 16 of module 1:

DGS-3400:4#show auth_session_statistics ports 1:16

Command: show auth_session_statistics ports 1:16

Port number : 1:16

```

create 802.1x guest_vlan

Purpose	Used to configure a pre-existing VLAN as a 802.1x Guest VLAN.
Syntax	create 802.1x guest_vlan <vlan_name 32>
Description	The create 802.1x guest_vlan command is used to configure a pre-defined VLAN as a 802.1x Guest VLAN. Guest 802.1X VLAN clients are those who have not been authorized for 802.1x or they haven't yet installed the necessary 802.1x software, yet would still like limited access rights on the Switch.
Parameters	<vlan_name 32> - Enter an alphanumeric string of no more than 32 characters to define a pre-existing VLAN as a 802.1x Guest VLAN. This VLAN must have first been created with the create vlan command mentioned earlier in this manual.
Restrictions	Only administrator-level users can issue this command. Users must have already previously created a VLAN using the create vlan command. Only one VLAN can be set as the 802.1x Guest VLAN.

Example usage:

To configure a previously created VLAN as a 802.1x Guest VLAN for the Switch.

```
DGS-3400:4#create 802.1x guest_vlan Trinity
Command: create 802.1x guest_vlan Trinity

Success.

DGS-3400:4#
```

config 802.1x guest_vlan ports

Purpose	Used to configure ports for a pre-existing 802.1x guest VLAN.
Syntax	config 802.1x guest_vlan ports [<portlist> all] state [enable disable]
Description	The config 802.1x guest_vlan ports command is used to configure ports to be enabled or disabled for the 802.1x guest VLAN.
Parameters	<portlist> - Specify a port or range of ports to be configured for the 802.1x Guest VLAN. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specify this parameter to configure all ports for the 802.1x Guest VLAN. state [enable disable] – Use these parameters to enable or disable port listed here as enabled or disabled for the 802.1x Guest VLAN.
Restrictions	Only administrator-level users can issue this command. Users must have already previously created a VLAN using the create vlan command. If the specific port state changes from an enabled state to a disabled state, these ports will return to the default VLAN.

Example usage:

To configure the ports for a previously created 802.1x Guest VLAN as enabled.

```
DGS-3400:4#config 802.1x guest_vlan ports 1:1-1:5 state enable
Command: config 802.1x guest_vlan ports 1:1-1:5 state enable

Success.

DGS-3400:4#
```

show 802.1x guest_vlan

Purpose	Used to view the configurations for a 802.1x Guest VLAN.
Syntax	show 802.1x guest_vlan
Description	The show 802.1x guest_vlan command is used to display the settings for the VLAN that has been enabled as an 802.1x Guest VLAN. Guest 802.1X VLAN clients are those who have not been authorized for 802.1x or they haven't yet installed the necessary 802.1x software, yet would still like limited access rights on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To configure the configurations for a previously created 802.1x Guest VLAN.

```
DGS-3400:4#show 802.1x guest_vlan
Command: show 802.1x guest_vlan

Guest VLAN Setting
-----
Guest VLAN : Trinity
Enable guest VLAN ports: 1:5-1:8

DGS-3400:4#
```

delete 802.1x guest_vlan

Purpose	Used to delete a 802.1x Guest VLAN.
Syntax	delete 802.1x guest_vlan {<vlan_name 32>}
Description	The delete 802.1x guest_vlan command is used to delete an 802.1x Guest VLAN. Guest 802.1X VLAN clients are those who have not been authorized for 802.1x or they haven't yet installed the necessary 802.1x software, yet would still like limited access rights on the Switch.
Parameters	<vlan_name 32> - Enter the VLAN name of the Guest 802.1x VLAN to be deleted.
Restrictions	Only administrator-level users can issue this command. Users must have already previously created a VLAN using the create vlan command. Only one VLAN can be set as the 802.1x Guest VLAN.

Example usage:

To delete a previously created 802.1x Guest VLAN.

```
DGS-3400:4#delete 802.1x guest_vlan Trinity
Command: delete 802.1x guest_vlan Trinity

Success.

DGS-3400:4#
```

ACCESS CONTROL LIST (ACL) COMMANDS

The xStack DGS-3400 implements Access Control Lists that enable the Switch to deny network access to specific devices or device groups based on IP settings and MAC address.

Access profiles allows establishment of a criteria to determine whether or not the Switch will forward packets based on the information contained in each packet's header. These criteria can be specified on a VLAN-by-VLAN basis.

Creating an access profile is divided into two basic parts. First, an access profile must be created using the **create access_profile** command. For example, if you want to deny all traffic to the subnet 10.42.73.0 to 10.42.73.255, you must first **create** an access profile that instructs the Switch to examine all of the relevant fields of each frame:

CREATE ACCESS_PROFILE PROFILE_ID 1 IP SOURCE_IP_MASK 255.255.255.0

Here we have created an access profile that will examine the IP field of each frame received by the Switch. Each source IP address the Switch finds will be combined with the **source_ip_mask** with a logical AND operation. The **profile_id** parameter is used to give the access profile an identifying number – in this case, 1. The **deny** parameter instructs the Switch to filter any frames that meet the criteria – in this case, when a logical AND operation between an IP address specified in the next step and the **ip_source_mask** match.

The default for an access profile on the Switch is to **permit** traffic flow. To restrict traffic, users must use the **deny** parameter.

Now that an access profile has been created, you must add the criteria the Switch will use to decide if a given frame should be forwarded or filtered. Here, we want to filter any packets that have an IP source address between 10.42.73.0 and 10.42.73.255:

config access_profile profile_id 1 add access_id 1 ip source_ip 10.42.73.1 port 1 deny

Here we use the **profile_id 1** which was specified when the access profile was created. The **add** parameter instructs the Switch to add the criteria that follows to the list of rules that are associated with access profile 1. For each rule entered into the access profile, you can assign an **access_id** that both identifies the rule and establishes a priority within the list of rules. A lower **access_id** gives the rule a higher priority. In case of a conflict in the rules entered for an access profile, the rule with the highest priority (lowest **access_id**) will take precedence.

The **ip** parameter instructs the Switch that this new rule will be applied to the IP addresses contained within each frame's header. **source_ip** tells the Switch that this rule will apply to the source IP addresses in each frame's header. Finally, the IP address **10.42.73.1** will be combined with the **source_ip_mask 255.255.255.0** to give the IP address 10.42.73.0 for any source IP address between 10.42.73.0 to 10.42.73.255.

Due to a chipset limitation, the Switch supports a maximum of 6 access profiles. The rules used to define the access profiles are limited to a total of 768 rules for the Switch. One rule can support ACL per port or per portmap.

The access profile commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create access_profile	profile_id <value 1-6> [ethernet {vlan source_mac <macmask 000000000000-ffffffff> destination_mac <macmask 000000000000-ffffffff> 802.1p ethernet_type} ip {source_ip_mask <netmask> destination_ip_mask <netmask> dscp [icmp igmp tcp {src_port_mask <hex 0x0-0xffff> dst_port_mask <hex 0x0-0xffff> flag_mask [all {urg ack psh rst syn fin}]} udp {src_port_mask <hex 0x0-0xffff> dst_port_mask <hex 0x0-0xffff>} protocol_id_mask <hex 0x0-0xff> {user_define_mask <hex 0x0-0xffffffff>}}] ipv6 {[class flowlabel] source_ipv6_mask <ipv6mask> destination_ipv6_mask <ipv6mask>}] profile_id <value 1-6>

delete cpu access_profile	profile_id <value 1-5>
config cpu access_profile	profile_id <value 1-5> [add access_id <value 1-100> [ethernet {vlan <vlan_name 32> source_mac <macaddr 000000000000-ffffffff> destination_mac <macaddr 000000000000-ffffffff> 802.1p <value 0-7> ethernet_type <hex 0x0-0xffff>} port [<portlist> all] [permit deny] ip {vlan <vlan_name 32> source_ip <ipaddr> destination_ip <ipaddr> dscp <value 0-63> icmp {type <value 0-255> code <value 0-255>} igmp {type <value 0-255>} tcp {src_port <value 0-65535> dst_port <value 0-65535> urg ack psh rst syn fin}]} udp {src_port <value 0-65535> dst_port <value 0-65535>} protocol_id <value 0 - 255> {user_define <hex 0x0-0xffffffff>}}} port [<portlist> all] [permit deny] packet_content {offset_0-15 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_16-31 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_32-47 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_48-63 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_64-79 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff>} port [<portlist> all] [permit deny] {time_range <range_name 32>} delete access_id <value 1-100>]
show cpu access_profile	{profile_id <value 1-5>}

Each command is listed, in detail, in the following sections.

create access_profile (for Ethernet)

Purpose	Used to create an access profile on the Switch by examining the Ethernet part of the packet header. Masks entered can be combined with the values the Switch finds in the specified frame header fields. Specific values for the rules are entered using the config access_profile command, below.
Syntax	create access_profile profile_id <value 1-6> [ethernet {vlan source_mac <macmask 000000000000-ffffffff> destination_mac <macmask 000000000000-ffffffff> 802.1p ethernet_type}
Description	This command will allow the user to create a profile for packets that may be accepted or denied by the Switch by examining the Ethernet part of the packet header. Specific values for rules pertaining to the Ethernet part of the packet header may be defined by configuring the config access_profile command for Ethernet, as stated below.

create access_profile (for Ethernet)

Parameters	<i>profile_id</i> <value 1-6> - Specifies an index number between 1 and 6 that will identify the access profile being created with this command. <i>ethernet</i> - Specifies that the Switch will examine the layer 2 part of each packet header with emphasis on one or more of the following: <i>vlan</i> - Specifies that the Switch will examine the VLAN part of each packet header. <i>source_mac</i> <macmask> - Specifies a MAC address mask for the source MAC address. This mask is entered in the following hexadecimal format: 000000000000-FFFFFFFFFFFF <i>destination_mac</i> <macmask> - Specifies a MAC address mask for the destination MAC address in the following format: 000000000000-FFFFFFFFFFFF <i>802.1p</i> - Specifies that the Switch will examine the 802.1p priority value in the frame's header. <i>ethernet_type</i> - Specifies that the Switch will examine the Ethernet type value in each frame's header.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create an Ethernet access profile:

```
DGS-3400:4# create access_profile profile_id 1 ethernet vlan 802.1p
Command: create access_profile profile_id 1 ethernet vlan 802.1p

Success.

DGS-3400:4#
```

config access_profile (for Ethernet)

Purpose	Used to configure the Ethernet access profile on the Switch and to define specific values for the rules that will be used to by the Switch to determine if a given packet should be forwarded or filtered. Masks entered using the create access_profile command will be combined, using a logical AND operational method, with the values the Switch finds in the specified frame header fields.
Syntax	config access_profile profile_id <value 1-6> [add access_id [auto_assign <value 1-128>] [ethernet {vlan <vlan_name 32> source_mac <macaddr 000000000000-ffffffff> destination_mac <macaddr 000000000000-ffffffff> 802.1p <value 0-7> ethernet_type <hex 0x0-0xffff>} port [<portlist> all] [permit {priority <value 0-7> {replace_priority} rx_rate [no_limit <value 1-156249>]} deny]} {time_range <range_name 32>} delete access_id <value 1-128>]
Description	This command is used to define the rules used by the Switch to either filter or forward packets based on the Ethernet part of each packet header.
Parameters	<i>profile_id</i> <value 1-6> - Enter an integer between 1 and 6 that is used to identify the access profile that will be configured with this command. This value is assigned to the access profile when it is created with the create access_profile command. The lower the profile ID, the higher the priority the rule will be given. <i>add access_id</i> <value 1-128> - Adds an additional rule to the above specified access profile. The value specifies the relative priority of the additional rule. Up to 128 different rules may be configured for the Ethernet access profile. <i>auto_assign</i> - Choose this parameter to configure the Switch to automatically assign a numerical value (between 1 and 128) for the rule being configured. <i>ethernet</i> - Specifies that the Switch will look only into the layer 2 part of each packet to determine if it is to be filtered or forwarded based on one or more of the following: <i>vlan</i> <vlan_name 32> - Specifies that the access profile will apply to only this previously created VLAN. <i>source_mac</i> <macaddr> - Specifies that the access profile will apply to only packets

config access_profile (for Ethernet)

with this source MAC address. MAC address entries may be made in the following format: **000000000000-FFFFFFFFFFFF**

- **destination_mac <macaddr>** – Specifies that the access profile will apply to only packets with this destination MAC address. MAC address entries may be made in the following format: **000000000000-FFFFFFFFFFFF**
- **802.1p <value 0-7>** – Specifies that the access profile will apply only to packets with this 802.1p priority value.
- **ethernet_type <hex 0x0-0xffff>** – Specifies that the access profile will apply only to packets with this hexadecimal 802.1Q Ethernet type value in the packet header.

port <portlist> | all - The access profile for Ethernet may be defined for each port on the Switch. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Up to 128 rules may be configured for each port. The user may select all ports by entering the **all** parameter. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

permit – Specifies that packets that match the access profile are permitted to be forwarded by the Switch.

- **priority <value 0-7>** – This parameter is specified if you want to re-write the 802.1p default priority previously set in the Switch, which is used to determine the CoS queue to which packets are forwarded to. Once this field is specified, packets accepted by the Switch that match this priority are forwarded to the CoS queue specified previously by the user.
- **{replace_priority}** – Enter this parameter if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch.

rx_rate – Use this to limit Rx bandwidth for the profile being configured. This rate is implemented using the following equation – 1 value = 64kbit/sec. (ex. If the user selects a rx rate of 10 then the ingress rate is 640kbit/sec.) The user may select a value between 1-156249 or no limit. The default setting is no limit.

deny – Specifies that packets that do not match the access profile are not permitted to be forwarded by the Switch and will be filtered.

{time_range <range_name 32>} – Choose this parameter and enter the name of the Time Range settings that has been previously configured using the **config time_range** command. This will set specific times when this access rule will be enabled or disabled on the Switch.

delete access_id <value 1-128> – Use this command to delete a specific rule from the Ethernet profile. Up to 128 rules may be specified for the Ethernet access profile.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure a rule for the Ethernet access profile:

```
DGS-3400:4#config access profile profile_id 1 add access_id 1 ethernet vlan Trinity
802.1p 1 port 1:1 permit priority 1 replace priority
Command: config access profile profile_id 1 add access_id 1 ethernet vlan Trinity
802.1p 1 port 1:1 permit priority 1 replace priority
```

Success.

```
DGS-3400:4#
```

create access_profile (IP)

Purpose	Used to create an access profile on the Switch by examining the IP part of the packet header. Masks entered can be combined with the values the Switch finds in the specified frame header fields. Specific values for the rules are entered using the config access_profile command, below.
Syntax	create access_profile profile_id <value 1-6> ip {source_ip_mask <netmask> destination_ip_mask <netmask> dscp [icmp igmp tcp {src_port_mask <hex 0x0-0xffff> dst_port_mask <hex 0x0-0xffff> flag_mask [all {urg ack psh rst syn fin}]} udp {<hex 0x0-0xffff> dst_port_mask <hex 0x0-0xffff>} protocol_id_mask {<hex 0x0-0xff> [user_define_mask <hex 0x0-0xffffffff>}]}
Description	This command will allow the user to create a profile for packets that may be accepted or denied by the Switch by examining the IP part of the packet header. Specific values for rules pertaining to the IP part of the packet header may be defined by configuring the config access_profile command for IP, as stated below.
Parameters	<i>ip</i> - Specifies that the Switch will look into the IP fields in each packet with special emphasis on one or more of the following: • <i>profile_id <value 1-6></i> - Specifies an index number between 1 and 6 that will identify the access profile being created with this command. • <i>source_ip_mask <netmask></i> - Specifies an IP address mask for the source IP address. • <i>destination_ip_mask <netmask></i> - Specifies an IP address mask for the destination IP address. • <i>dscp</i> - Specifies that the Switch will examine the DiffServ Code Point (DSCP) field in each frame's header. • <i>icmp</i> - Specifies that the Switch will examine the Internet Control Message Protocol (ICMP) field in each frame's header. • <i>igmp</i> - Specifies that the Switch will examine each frame's Internet Group Management Protocol (IGMP) field. • <i>tcp</i> - Specifies that the Switch will examine each frames Transport Control Protocol (TCP) field. • <i>src_port_mask <hex 0x0-0xffff></i> - Specifies a TCP port mask for the source port. • <i>dst_port_mask <hex 0x0-0xffff></i> - Specifies a TCP port mask for the destination port. • <i>flag_mask [all {urg ack psh rst syn fin}]</i> - Enter the appropriate flag_mask parameter. All incoming packets have TCP port numbers contained in them as the forwarding criterion. These numbers have flag bits associated with them which are parts of a packet that determine what to do with the packet. The user may deny packets by denying certain flag bits within the packets. The user may choose between <i>all</i>, <i>urg</i> (urgent), <i>ack</i> (acknowledgement), <i>psh</i> (push), <i>rst</i> (reset), <i>syn</i> (synchronize) and <i>fin</i> (finish). • <i>udp</i> - Specifies that the Switch will examine each frame's Universal Datagram Protocol (UDP) field. • <i>src_port_mask <hex 0x0-0xffff></i> - Specifies a UDP port mask for the source port. • <i>dst_port_mask <hex 0x0-0xffff></i> - Specifies a UDP port mask for the destination port. • <i>protocol_id_mask</i> - Specifies that the Switch will examine each frame's Protocol ID field. • <i><hex 0x0-0xff></i> - Enter a hexadecimal value that will identify the protocol to be discovered in the packet header. • <i>user_define <hex 0x0-0xffffffff></i> - Enter a hexadecimal value that will identify the user defined protocol to be discovered in the packet header.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure a rule for the IP access profile:

```
DGS-3400:4# create access_profile profile_id 2 ip protocol_id_mask 0xFF
```

```
Command: create access_profile profile_id 2 ip protocol_id_mask 0xFF
```

```
Success.
```

```
DGS-3400:4#
```

config access_profile (IP)

Purpose	Used to configure the IP access profile on the Switch and to define specific values for the rules that will be used to by the Switch to determine if a given packet should be forwarded or filtered. Masks entered using the create access_profile command will be combined, using a logical AND operational method, with the values the Switch finds in the specified frame header fields.
Syntax	config access_profile profile_id <value 1-6> [add access_id [auto_assign <value 1-128>] ip { source_ip <ipaddr> destination_ip <ipaddr> dscp <value 0-63> [icmp igmp tcp { src_port <value 0-65535> dst_port <value 0-65535> urg ack psh rst syn fin } udp { src_port <value 0-65535> dst_port <value 0-65535>} protocol_id <value 0-255> { user_define <hex 0x0-0xffffffff>}}] port [<portlist> all] [permit { priority <value 0-7> { replace_priority } replace_dscp <value 0-63>} rx_rate [no_limit <value 1-156249>}] deny }] { time_range <range_name 32>} delete access_id <value 1-128>]
Description	This command is used to define the rules used by the Switch to either filter or forward packets based on the IP part of each packet header.
Parameters	profile_id <value 1-6> - Enter an integer between 1 and 6 that is used to identify the access profile that will be configured with this command. This value is assigned to the access profile when it is created with the create access_profile command. The lower the profile ID, the higher the priority the rule will be given. add access_id <value 1-128> - Adds an additional rule to the above specified access profile. The value specifies the relative priority of the additional rule. Up to 128 different rules may be configured for the IP access profile. auto_assign - Choose this parameter to configure the Switch to automatically assign a numerical value (between 1 and 128) for the rule being configured. ip - Specifies that the Switch will look into the IP fields in each packet to see if it will be either forwarded or filtered based on one or more of the following: source_ip <ipaddr> - Specifies that the access profile will apply to only packets with this source IP address. destination_ip <ipaddr> - Specifies that the access profile will apply to only packets with this destination IP address. dscp <value 0-63> - Specifies that the access profile will apply only to packets that have this value in their Type-of-Service (DiffServ code point, DSCP) field in their IP packet header. icmp - Specifies that the Switch will examine the Internet Control Message Protocol (ICMP) field within each packet. igmp - Specifies that the access profile will apply to packets that have this IGMP type. tcp - Specifies that the switch will examine each frames Transport Control Protocol (TCP) field. src_port <value 0-65535> - Specifies that the access profile will apply only to packets that have this TCP source port in their TCP header. dst_port <value 0-65535> - Specifies that the access profile will apply only to packets that have this TCP destination port in their TCP header. - Enter the type of TCP flag to be masked. The choices are: urg: TCP control flag (urgent) ack: TCP control flag (acknowledgement) psh: TCP control flag (push)

config access_profile (IP)

- *rst*: TCP control flag (reset)
- *syn*: TCP control flag (synchronize)
- *fin*: TCP control flag (finish)
- *udp* – Specifies that the Switch will examine the Universal Datagram Protocol (UDP) field in each packet.
 - *src_port* <value 0-65535> – Specifies that the access profile will apply only to packets that have this UDP source port in their header.
 - *dst_port* <value 0-65535> – Specifies that the access profile will apply only to packets that have this UDP destination port in their header.
- *protocol_id* <value 0-255> – Specifies that the Switch will examine the Protocol field in each packet and if this field contains the value entered here, apply the appropriate rules.
- *user_define* <hex 0x0-0xffffffff> – Enter a hexadecimal value that will identify the protocol to be discovered in the packet header.

port <portlist> | *all* - The access profile for IP may be defined for each port on the Switch. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Up to 128 rules may be configured for each port. Selecting *all* will configure this rule for all ports on the Switch. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

permit – Specifies that packets that match the access profile are permitted to be forwarded by the Switch.

- *priority* <value 0-7> – This parameter is specified if you want to re-write the 802.1p default priority previously set in the Switch, which is used to determine the CoS queue to which packets are forwarded to. Once this field is specified, packets accepted by the Switch that match this priority are forwarded to the CoS queue specified previously by the user.
- *{replace_priority}* – Enter this parameter if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch.

replace_dscp <value 0-63> – Allows you to specify a value to be written to the DSCP field of an incoming packet that meets the criteria specified in the first part of the command. This value will over-write the value in the DSCP field of the packet.

rx_rate - Use this to limit Rx bandwidth for the profile being configured. This rate is implemented using the following equation – 1 value = 64kbit/sec. (ex. If the user selects a rx rate of 10 then the ingress rate is 640kbit/sec.) The user may select a value between 1- 156249 or no limit. The default setting is no limit.

deny – Specifies that packets that do not match the access profile are not permitted to be forwarded by the Switch and will be filtered.

{time_range <range_name 32>} – Choose this parameter and enter the name of the Time Range settings that has been previously configured using the **config time_range** command. This will set specific times when this access rule will be enabled or disabled on the Switch.

delete access_id <value 1-128> – Use this command to delete a specific rule from the IP profile. Up to 128 rules may be specified for the IP access profile.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure a rule for the IP access profile:

```
DGS-3400:4#config access_profile profile_id 2 add access_id 2 ip protocol_id 2 port 1:2 deny
Command: config access_profile profile_id 2 add access_id 2 ip protocol_id 2 port 1:2 deny
```

Success.

```
DGS-3400:4#
```

create access_profile (ipv6)

Purpose	Used to create an access profile on the Switch by examining the IPv6 part of the packet header. Masks can be entered that will be combined with the values the Switch finds in the specified frame header fields. Specific values for the rules are entered using the config access_profile command, below.
Syntax	create access_profile profile_id <value 1-6> ipv6 [{class flowlabel source_ipv6_mask <ipv6mask> destination_ipv6_mask <ipv6mask>}]
Description	This command is used to identify various parts of IPv6 packets that enter the Switch so they can be either forwarded or filtered.
Parameters	<i>profile_id</i> <value 1-6> - Specifies an index number between 1 and 6 that will identify the access profile being created with this command. <i>ipv6</i> – Denotes that IPv6 packets will be examined by the Switch for forwarding or filtering based on the rules configured in the config access_profile command for IPv6. IPv6 packets may be identified by the following: <i>class</i> – Entering this parameter will instruct the Switch to examine the <i>class</i> field of the IPv6 header. This class field is a part of the packet header that is similar to the Type of Service (ToS) or Precedence bits field in IPv4. <i>flowlabel</i> – Entering this parameter will instruct the Switch to examine the <i>flow label</i> field of the IPv6 header. This flow label field is used by a source to label sequences of packets such as non-default quality of service or real time service packets. <i>source_ipv6_mask</i> <ipv6mask> - Specifies an IP address mask for the source IPv6 address. <i>destination_ipv6_mask</i> <ipv6mask> - Specifies an IP address mask for the destination IPv6 address.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create an access profile based on IPv6 classification:

```
DGS-3400:4#create access_profile profile_id 4 ipv6 class flowlabel
```

```
Command: create access_profile profile_id 4 ipv6 class flowlabel
```

Success.

```
DGS-3400:4#
```

config access_profile profile_id (ipv6)

Purpose	Used to configure the IPv6 access profile on the Switch and to define specific values for the rules that will be used to by the Switch to determine if a given packet should be forwarded or filtered. Masks entered using the create access_profile command will be combined, using a logical AND operational method, with the values the Switch finds in the specified frame header fields.
Syntax	config access_profile profile_id <value 1-6> add access_id [auto_assign <value 1-128>] ipv6 {class <value 0-255> flowlabel <hex 0x0-0xffff> source_ipv6

config access_profile profile_id (ipv6)

```
<ipv6addr> | destination_ipv6 <ipv6addr> port [<portlist> | all] [permit {priority
<value 0-7> {replace_priority} | rx_rate [no_limit | value 1-156249]} | deny]]
{time_range <range_name 32>} | delete access_id <value 1-128>]
```

Description

This command is used to define the rules used by the Switch to either filter or forward packets based on the IPv6 part of each packet header.

Parameters

profile_id <value 1-6> - Enter an integer between 1 and 6 that is used to identify the access profile that will be configured with this command. This value is assigned to the access profile when it is created with the **create access_profile** command. The lower the profile ID, the higher the priority the rule will be given.

add access_id <value 1-128> - Adds an additional rule to the above specified access profile. The value specifies the relative priority of the additional rule. Up to 128 different rules may be configured for the IPv6 access profile.

- *auto_assign* – Choose this parameter to configure the Switch to automatically assign a numerical value (between 1 and 128) for the rule being configured.

ipv6 - Specifies that the Switch will look into the IPv6 fields in each packet, with emphasis on one or more of the following fields:

- *class* <value 0-255> - Entering this parameter will instruct the Switch to examine the *class* field of the IPv6 header. This class field is a part of the packet header that is similar to the Type of Service (ToS) or Precedence bits field in IPv4.
- *flowlabel* <hex 0x0-ffff> - Entering this parameter will instruct the Switch to examine the flow label field of the IPv6 header. This flow label field is used by a source to label sequences of packets such as non-default quality of service or real time service packets. This field is to be defined by the user in hex form.
- *source_ipv6* <ipv6addr> - Specifies an IP address mask for the source IPv6 address.
- *destination_ipv6* <ipv6addr> - Specifies an IP address mask for the destination IPv6 address.

port <portlist> | *all* - The access profile for Ethernet may be defined for each port on the Switch. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Up to 128 rules may be configured for each port. Selecting *all* will configure this rule for all ports on the Switch. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

permit – Specifies that packets that match the access profile are permitted to be forwarded by the Switch.

- *priority* <value 0-7> – This parameter is specified to re-write the 802.1p default priority previously set in the Switch, which is used to determine the CoS queue to which packets are forwarded to. Once this field is specified, packets accepted by the Switch that match this priority are forwarded to the CoS queue specified previously by the user.
- *{replace_priority}* – Enter this parameter to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch.

rx_rate - Use this to limit Rx bandwidth for the profile being configured. This rate is implemented using the following equation – 1 value = 64kbit/sec. (ex. If the user selects a rx rate of 10 then the ingress rate is 640kbit/sec.) The user may select a value between 1- 156249 or *no_limit*. The default setting is *no_limit*.

config access_profile profile_id (ipv6)

deny – Specifies that packets that match the access profile are not permitted to be forwarded by the Switch and will be filtered.

{time_range <range_name 32>} – Choose this parameter and enter the name of the Time Range settings that has been previously configured using the **config time_range** command. This will set specific times when this access rule will be enabled or disabled on the Switch.

delete access_id <value 1-128> – Use this command to delete a specific rule from the IPv6 profile. Up to 128 rules may be specified for the IPv6 access profile.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure a previously created access profile based on IPv6 classification:

```
DGS-3400:4#config access_profile profile_id 4 add access_id 1 ipv6
class 1 flowlabel 0xABCD port 1:4 deny
Command: config access_profile profile_id 4 add access_id 1 ipv6
class 1 flowlabel 0xABCD port 1:4 deny
```

Success.

```
DGS-3400:4#
```

delete access_profile

Purpose Used to delete a previously created access profile.

Syntax **delete access_profile {profile_id <value 1-6> | all}**

Description The **delete access_profile** command is used to delete a previously created access profile on the Switch.

Parameters *profile_id <value 1-6>* – Enter an integer between 1 and 6 that is used to identify the access profile that will be deleted with this command. This value is assigned to the access profile when it is created with the **create access_profile** command.

all – Using this parameter will delete all IP profiles currently configured on the switch, except for those automatically created using the IP-MAC binding commands.

Restrictions Only administrator-level users can issue this command.

Example usage:

To delete the access profile with a profile ID of 1:

```
DGS-3400:4# delete access_profile profile_id 1
Command: delete access_profile profile_id 1
```

Success.

```
DGS-3400:4#
```

show access_profile

Purpose Used to display the currently configured access profiles on the Switch.

Syntax **show access_profile {profile_id <value 1-6>}**

Description The **show access_profile** command is used to display the currently configured access profiles.

show access_profile

Parameters *profile_id <value 1-6>* – Enter an integer between 1 and 6 that is used to identify the access profile that will be viewed with this command. This value is assigned to the access profile when it is created with the **create access_profile** command.

Entering this command without the *profile_id* parameter will command the Switch to display all access profile entries.

Restrictions None.

Example usage:

To display all of the currently configured access profiles on the Switch:

```
DGS-3400:4#show access_profile
Command: show access_profile

```

create cpu access_profile

Purpose	Used to create an access profile specifically for CPU Interface Filtering on the Switch and to define which parts of each incoming frame's header the Switch will examine. Masks can be entered that will be combined with the values the Switch finds in the specified frame header fields. Specific values for the rules are entered using the config cpu access_profile command, below.
Syntax	create cpu access_profile [ethernet {vlan source_mac <macaddr 000000000000-ffffffff> destination_mac <macaddr 000000000000-ffffffff> 802.1p ethernet_type} ip {vlan source_ip_mask <netmask> destination_ip_mask <netmask> dscp [icmp {type code} igmp {type} tcp {src_port_mask <hex 0x0-0xffff> dst_port_mask <hex 0x0-0xffff>} flag_mask [all {urg ack psh rst syn fin}]} udp {src_port_mask <hex 0x0-0xffff> dst_port_mask <hex 0x0-0xffff>} protocol_id_mask <hex 0x0-0xff>} {user_define_mask <hex 0x0-0xffffffff>}]} packet_content_mask {offset 0-15 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset 16-31 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> {offset 32-47 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> {offset 48-63 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> {offset 64-79 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff>}}] profile_id <value 1-5>
Description	The create cpu access_profile command is used to create an access profile used only for CPU Interface Filtering. Masks can be entered that will be combined with the values the Switch finds in the specified frame header fields. Specific values for the rules are entered using the config cpu access_profile command, below.
Parameters	ethernet – Specifies that the Switch will examine the layer 2 part of each packet header. vlan – Specifies that the Switch will examine the VLAN part of each packet header. source_mac <macaddr 000000000000-ffffffff> - Specifies to examine the source MAC address mask. MAC address entries may be made in the following format: 000000000000-FFFFFFFF destination_mac <macaddr 000000000000-ffffffff> - Specifies to examine the destination MAC address mask. MAC address entries may be made in the following format: 000000000000-FFFFFFFF 802.1p - Specifies that the Switch will examine the 802.1p priority value in the frame's header. ethernet_type – Specifies that the switch will examine the Ethernet type value in each frame's header. ip – Specifies that the switch will examine the IP address in each frame's header. vlan – Specifies a VLAN mask. source_ip_mask <netmask> – Specifies an IP address mask for the source IP address. destination_ip_mask <netmask> – Specifies an IP address mask for the destination IP address. dscp – Specifies that the switch will examine the DiffServ Code Point (DSCP) field in each frame's header. icmp – Specifies that the switch will examine the Internet Control Message Protocol (ICMP) field in each frame's header. type – Specifies that the switch will examine each frame's ICMP Type field. code – Specifies that the switch will examine each frame's ICMP Code field. igmp – Specifies that the switch will examine each frame's Internet Group Management Protocol (IGMP) field. type – Specifies that the switch will examine each frame's IGMP Type field. tcp – Specifies that the switch will examine each frames Transport Control Protocol (TCP) field. src_port_mask <hex 0x0-0xffff> – Specifies a TCP port mask for the source port. dst_port_mask <hex 0x0-0xffff> – Specifies a TCP port mask for the destination port. flag_mask [all {urg ack psh rst syn fin}] – Enter the appropriate flag_mask parameter. All incoming packets have TCP port numbers contained in them as the forwarding criterion. These numbers have flag bits associated with them which are parts of a packet that determine what to do with the packet. The user may deny packets by denying certain flag bits within the packets. The user may choose between all, urg (urgent), ack

create cpu access_profile

(acknowledgement), **psh** (push), **rst** (reset), **syn** (synchronize) and **fin** (finish).

- **udp** – Specifies that the switch will examine each frame's Universal Datagram Protocol (UDP) field.
 - **src_port_mask** <hex 0x0-0xffff> – Specifies a UDP port mask for the source port.
 - **dst_port_mask** <hex 0x0-0xffff> – Specifies a UDP port mask for the destination port.
- **protocol_id_mask** <hex 0x0-0xffffffff> – Specifies that the Switch will examine each frame's Protocol ID field using the hex form entered here.
 - **user_define_mask** <hex 0x0-0xff> – Specifies that the rule applies to the IP protocol ID and the mask options behind the IP header.
- **packet_content_mask** – Specifies that the switch will mask the packet header beginning with the offset value specified as follows:
 - **offset_0-15** - Enter a value in hex form to mask the packet from byte 0 to byte 15.
 - **offset_16-31** - Enter a value in hex form to mask the packet from byte 16 to byte 31.
 - **offset_32-47** - Enter a value in hex form to mask the packet from byte 32 to byte 47.
 - **offset_48-63** - Enter a value in hex form to mask the packet from byte 48 to byte 63.
 - **offset_64-79** - Enter a value in hex form to mask the packet from byte 64 to byte 79.

profile_id <value 1-5> – Enter an integer between 1 and 5 that is used to identify the CPU access profile to be deleted with this command.

Restrictions Only administrator-level users can issue this command.

Example usage:

To create a CPU access profile:

```
DGS-3400:4# create cpu access_profile profile_id 1 ip vlan source_ip_mask 20.0.0.0
destination_ip_mask 10.0.0.0 dscp icmp type code
Command: create cpu access_profile profile_id 1 ip vlan source_ip_mask 20.0.0.0
destination_ip_mask 10.0.0.0 dscp icmp type code

Success.

DGS-3400:4#
```

delete cpu access_profile

Purpose	Used to delete a previously created access profile or cpu access profile.
Syntax	delete cpu access_profile [profile_id <value 1-5> all]
Description	The delete cpu access_profile command is used to delete a previously created cpu access profile.
Parameters	profile_id <value 1-5> – Enter an integer between 1 and 5 that is used to identify the CPU access profile to be deleted with this command. This value is assigned to the access profile when it is created with the create cpu access_profile command. all – Entering this parameter will delete all CPU access profiles currently set on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the CPU access profile with a profile ID of 1:

```
DGS-3400:4#delete cpu access_profile profile_id 1
Command: delete cpu access_profile profile_id 1

Success.

DGS-3400:4#
```

config cpu access_profile

Purpose	Used to configure a cpu access profile used for CPU Interface Filtering and to define specific values that will be used to by the Switch to determine if a given packet should be forwarded or filtered. Masks entered using the create cpu access_profile command will be combined, using a logical AND operation, with the values the Switch finds in the specified frame header fields. Specific values for the rules are entered using the config cpu access_profile command, below.
Syntax	<pre>config cpu access_profile profile_id <value 1-5> [add access_id <value 1-100> [ethernet {vlan <vlan_name 32> source_mac <macaddr 000000000000-ffffffff> destination_mac <macaddr 000000000000-ffffffff> 802.1p <value 0-7> ethernet_type <hex 0x0-0xffff>} port [<portlist> all] ip {vlan <vlan_name 32> source_ip <ipaddr> destination_ip <ipaddr> dscp <value 0-63> [icmp {type <value 0-255> code <value 0-255>} igmp { type <value 0-255>} tcp {src_port <value 0- 65535> dst_port <value 0-65535> flag [all {urg ack psh rst syn fin}]} udp {src_port <value 0-65535> dst_port <value 0-65535>} protocol_id <value 0 - 255> {user_define <hex 0x0-0xffffffff>}}] port [<portlist> all] [permit deny] packet_content {offset_0-15 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_16-31 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0- 0xffffffff> <hex 0x0-0xffffffff> offset_32-47 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_48-63 <hex 0x0-0xffffffff> <hex 0x0- 0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> offset_64-79 <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff> <hex 0x0-0xffffffff>} [<portlist> all] [permit deny] {time_range <range_name 32>} delete access_id <value 1-100>]</pre>
Description	The config cpu access_profile command is used to configure a CPU access profile for CPU Interface Filtering and to enter specific values that will be combined, using a logical AND operational method, with masks entered with the create cpu access_profile command, above.
Parameters	<i>profile_id</i> <value 1-5> – Enter an integer used to identify the access profile that will be configured with this command. This value is assigned to the access profile when it is created with the create access_profile command. The profile ID sets the relative priority for the profile and specifies an index number that will identify the access profile being created with this command. Priority is set relative to other profiles where the lowest profile ID has the highest priority. <i>add access_id</i> <value 1-100> – Adds an additional rule to the above specified access profile. The value is used to index the rule created. <i>ethernet</i> – Specifies that the Switch will look only into the layer 2 part of each packet. <i>vlan</i> <vlan_name 32> – Specifies that the access profile will apply to only to this VLAN. <i>source_mac</i> <macaddr 000000000000-ffffffff> – Specifies that the access profile will apply to this source MAC address. <i>destination_mac</i> <macaddr 000000000000-ffffffff> – Specifies that the access profile will apply to this destination MAC address. <i>ethernet_type</i> <hex 0x0-0xffff> – Specifies that the access profile will apply only to packets with this hexadecimal 802.1Q Ethernet type value in the packet header. <i>ip</i> – Specifies that the Switch will look into the IP fields in each packet. <i>vlan</i> <vlan_name 32> – Specifies that the access profile will apply to only this VLAN. <i>source_ip</i> <ipaddr> – Specifies that the access profile will apply to only packets with this source IP address. <i>destination_ip</i> <ipaddr> – Specifies that the access profile will apply to only packets with this destination IP address. <i>dscp</i> <value 0-63> – Specifies that the access profile will apply only to packets that have this value in their Type-of-Service (DiffServ code point, DSCP) field in their IP packet header <i>icmp</i> – Specifies that the Switch will examine the Internet Control Message Protocol (ICMP) field within each packet.

config cpu access_profile

	• <i>type</i> <value 0-255> – Specifies that the access profile will apply to this ICMP type value. • <i>code</i> <value 0-255> – Specifies that the access profile will apply to this ICMP code. • <i>igmp</i> – Specifies that the Switch will examine the Internet Group Management Protocol (IGMP) field within each packet. • <i>type</i> <value 0-255> – Specifies that the access profile will apply to packets that have this IGMP type value. • <i>tcp</i> – Specifies that the Switch will examine the Transmission Control Protocol (TCP) field within each packet. • <i>src_port</i> <value 0-65535> – Specifies that the access profile will apply only to packets that have this TCP source port in their TCP header. • <i>dst_port</i> <value 0-65535> – Specifies that the access profile will apply only to packets that have this TCP destination port in their TCP header. • <i>udp</i> – Specifies that the Switch will examine the Transmission Control Protocol (UDP) field within each packet. • <i>src_port</i> <value 0-65535> – Specifies that the access profile will apply only to packets that have this UDP source port in their header. • <i>dst_port</i> <value 0-65535> – Specifies that the access profile will apply only to packets that have this UDP destination port in their header. • <i>protocol_id</i> <value 0-255> – Specifies that the Switch will examine the protocol field in each packet and if this field contains the value entered here, apply the following rules. • <i>user_define_mask</i> <hex 0x0-0xffffffff> – Specifies that the rule applies to the IP protocol ID and the mask options behind the IP header.
Parameters	• <i>packet_content_mask</i> – Specifies that the Switch will mask the packet header beginning with the offset value specified as follows: • <i>offset_0-15</i> - Enter a value in hex form to mask the packet from byte 0 to byte 15. • <i>offset_16-31</i> - Enter a value in hex form to mask the packet from byte 16 to byte 31. • <i>offset_32-47</i> - Enter a value in hex form to mask the packet from byte 32 to byte 47. • <i>offset_48-63</i> - Enter a value in hex form to mask the packet from byte 48 to byte 63. • <i>offset_64-79</i> - Enter a value in hex form to mask the packet from byte 64 to byte 79. <portlist> <i>all</i> - Enter the port or ports to which this access profile applies. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Entering all will denote all profiles on the switch or in the switch stack. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>permit</i> <i>deny</i> – Specify that the packet matching the criteria configured with command will either be permitted entry to the cpu or denied entry to the CPU. <i>{time_range <range_name 32>}</i> – Choose this parameter and enter the name of the Time Range settings that has been previously configured using the config time_range command. This will set specific times when this access rule will be enabled or disabled on the Switch. <i>delete access_id</i> <value 1-100> - Use this to remove a previously created access rule in a profile ID.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure CPU access list entry:

```
DGS-3400:4#config cpu access_profile profile_id 5 add access_id 1 ip vlan default
source_ip 20.2.2.3 destination_ip 10.1.1.252 dscp 3 icmp type 11 code 32 deny
Command: config cpu access_profile profile_id 10 add access_id 1 ip vlan default
source_ip 20.2.2.3 destination_ip 10.1.1.252 dscp 3 icmp type 11 code 32 deny
```

Success.

DGS-3400:4#

show cpu_access_profile

Purpose	Used to view the CPU access profile entry currently set in the Switch.
Syntax	show cpu_access_profile {profile_id <value 1-5>}
Description	The config cpu_interface_filtering state command is used view the current CPU interface filtering entries set on the Switch.
Parameters	<i>profile_id <value 1-5></i> – Enter an integer between 1 and 5 that is used to identify the CPU access profile to be deleted with this command. This value is assigned to the access profile when it is created with the create cpu_access_profile command
Restrictions	None.

Example usage:

To show the CPU filtering state on the Switch:

```
DGS-3400:4#show cpu access_profile
```

Command: show cpu access_profile

CPU Interface Filtering State: Disabled

TIME RANGE COMMANDS

The Time Range commands are used in conjunction with the Access Profile commands listed in the previous chapter to determine a starting point and an ending point, based on days of the week, when an Access Profile configuration will be enabled on the Switch. Once configured here, the time range are to be applied to an access profile rule using the **config access_profile profile_id** command.

NOTE: The Time Range commands are based on the time settings of the Switch. Make sure to configure the time for the Switch appropriately for these commands using commands listed in the following chapter, **Time and SNTP Commands**.

The Time Range commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config time_range	<range_name 32> [hours start_time <time hh:mm:ss> end_time <time hh:mm:ss> weekdays <daylist> delete]
show time_range	

Each command is listed, in detail, in the following sections.

config time_range

Purpose	Used to configure a time range in which an access profile rule is to be enabled.
Syntax	config time_range <range_name 32> [hours start_time <time hh:mm:ss> end_time <time hh:mm:ss> weekdays <daylist> delete]
Description	This command is to be used in conjunction with an access profile rule to determine a period of time when an access profile and an associated rule are to be enabled on the Switch. Remember, this time range can only be applied to one period of time and also, it is based on the time set on the Switch.
Parameters	<i>range_name 32</i> – Enter a name of no more than 32 alphanumeric characters that will be used to identify this time range on the Switch. This range name will be used in the config access_profile profile_id command to identify the access profile and associated rule to be enabled for this time range. <i>hours</i> – This parameter is used to set the time in the day that this time range is to be set using the following parameters: <i>start time <time hh:mm:ss></i> - Use this parameter to identify the starting time of the time range, in hours, minutes and seconds, based on the 24-hour time system. <i>end time <time hh:mm:ss></i> - Use this parameter to identify the ending time of the time range, in hours, minutes and seconds, based on the 24-hour time system. <i>weekdays</i> – Use this parameter to determine the days of the week to set this time range. <i><daylist></i> - The user may set the days of the week here to set this time range in the three letter format (mon, tue, wed...). To specify a day range, separate the daylist using a dash (mon-fri would mean Monday through Friday). To specify a list of days in a week, separate the daylist using a comma, with no spaces (mon,tue,fri would mean Monday, Tuesday and Friday). <i>delete</i> – Use this parameter to delete a previously configured time range from the system.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the time range time1 to be between 6:30 a.m. and 9:40 p.m., Monday to Friday:

```
DGS-3400:4#config time_range time1 hours start_time 6:30:00 end_time
21:40:00 weekdays mon-fri
Command: config time_range time1 hours start_time 6:30:00 end_time
21:40:00 weekdays mon-fri

Success.

DGS-3400:4#
```

show time_range

Purpose	To view the current configurations of the time range set on the Switch.
Syntax	show time_range
Description	This command is used to display the currently configured time range(s) set on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To view the current time range settings.

```
DGS-3400:4#show time_range
Command: show time_range

Time Range information
-----
Range name   : time1
Weekdays    : Mon,Tue,Wed,Thu,Fri
Start time   : 06:30:00
End time     : 21:40:00

Total entries: 1

```

SAFEGUARD ENGINE COMMANDS

Periodically, malicious hosts on the network will attack the Switch by utilizing packet flooding (ARP Storm) or other methods. These attacks may increase the CPU utilization beyond its capability. To alleviate this problem, the Safeguard Engine function was added to the Switch's software.

The Safeguard Engine can help the overall operability of the Switch by minimizing the workload of the Switch while the attack is ongoing, thus making it capable to forward essential packets over its network in a limited bandwidth. When the Switch either (a) receives too many packets to process or (b) exerts too much memory, it will enter an **Exhausted** mode. When in this mode, the Switch will perform the following tasks to minimize the CPU usage:

1. It will limit bandwidth of receiving ARP packets. The user may implement this in two ways, by using the **config safeguard_engine** command.
 - a. When **strict** is chosen, the Switch will stop receiving ARP packets not destined for the Switch. This will eliminate all unnecessary ARP packets while allowing the essential ARP packets to pass through to the Switch's CPU.
 - b. When **fuzzy** is chosen, the Switch will minimize the ARP packet bandwidth received by the switch by adjusting the bandwidth for all ARP packets, whether destined for the Switch or not. The Switch uses an internal algorithm to filter ARP packets through, with a higher percentage set aside for ARP packets destined for the Switch.
2. It will limit the bandwidth of IP packets received by the Switch. The user may implement this in two ways, by using the **config safeguard_engine** command.
 - a. When **strict** is chosen, the Switch will stop receiving all unnecessary broadcast IP packets, even if the high CPU utilization is not caused by the high reception rate of broadcast IP packets.
 - b. When **fuzzy** is chosen, the Switch will minimize the IP packet bandwidth received by the Switch by adjusting the bandwidth for all IP packets, by setting a acceptable bandwidth for both unicast and broadcast IP packets. The Switch uses an internal algorithm to filter IP packets through while adjusting the bandwidth dynamically.

IP packets may also be limited by the Switch by configuring only certain IP addresses to be accepted. This method can be accomplished through the CPU Interface Filtering mechanism explained in the previous section. Once the user configures these acceptable IP addresses, other packets containing different IP addresses will be dropped by the Switch, thus limiting the bandwidth of IP packets. To keep the process moving fast, be sure not to add many conditions on which to accept these acceptable IP addresses and their packets, this limiting the CPU utilization.

Once in Exhausted mode, the packet flow will decrease by half of the level that caused the Switch to enter Exhausted mode. After the packet flow has stabilized, the rate will initially increase by 25% and then return to a normal packet flow.

NOTICE: When the Safeguard Engine is enabled, the Switch will allot bandwidth to various traffic flows (ARP, IP) using the FFP (Fast Filter Processor) metering table to control the CPU utilization and limit traffic. This may limit the speed of routing traffic over the network.

The Safeguard Engine commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config safeguard_engine	{state [enable disable] utilization {rising <value 20-100> falling <value 20-100>}} trap_log [enable disable] mode [strict fuzzy]}
show safeguard_engine	

Each command is listed, in detail, in the following sections.

config safeguard_engine

Purpose	To config ARP storm control for system.
Syntax	config safeguard_engine {state [enable disable] utilization {rising <value 20-100> falling <value 20-100>}} trap_log [enable disable] mode [strict fuzzy]}
Description	Use this command to configure Safeguard Engine to minimize the effects of an ARP storm.

config safeguard_engine

Parameters	<i>state</i> [<i>enable</i> <i>disable</i>] – Select the running state of the Safeguard Engine function as enable or disable. <i>utilization</i> – Select this option to trigger the Safeguard Engine function to enable based on the following determinates: • <i>rising</i> <value 20-100> - The user can set a percentage value of the rising CPU utilization which will trigger the Safeguard Engine function. Once the CPU utilization rises to this percentage, the Safeguard Engine mechanism will initiate. • <i>falling</i> <value 20-100> - The user can set a percentage value of the falling CPU utilization which will trigger the Safeguard Engine function to cease. Once the CPU utilization falls to this percentage, the Safeguard Engine mechanism will shut down. <i>trap_log</i> [<i>enable</i> <i>disable</i>] – Choose whether to enable or disable the sending of messages to the device's SNMP agent and switch log once the Safeguard Engine has been activated by a high CPU utilization rate. <i>mode</i> - Used to select the type of Safeguard Engine to be activated by the Switch when the CPU utilization reaches a high rate. The user may select: • <i>strict</i> – If selected, this function will instruct the Switch to minimize the IP and ARP traffic flow to the CPU by dynamically allotting an even bandwidth to all traffic flows. • <i>fuzzy</i> - If selected, this function will stop accepting all ARP packets not intended for the Switch, and will stop receiving all unnecessary broadcast IP packets, until the storm has subsided.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the safeguard engine for the Switch:

```
DGS-3400:4#config safeguard_engine state enable utilization rising 45
Command: config safeguard_engine state enable utilization rising 45

Success.

DGS-3400:4#
```

show safeguard_engine

Purpose	Used to display current Safeguard Engine settings.
Syntax	show safeguard_engine
Description	This will list the current status and type of the Safeguard Engine settings currently configured.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To display the safeguard engine status:

DGS-3400:4#show safeguard_engine

Command: show safeguard_engine

Safeguard engine state : Disabled

Safeguard engine current status : normal mode

=====

CPU utilization information:

Rising : 30%

Falling : 20%

Trap/Log state : Disabled

Mode : Fuzzy

DGS-3400:4#

TRAFFIC SEGMENTATION COMMANDS

Traffic segmentation allows you to further sub-divide VLANs into smaller groups of ports that will help to reduce traffic on the VLAN. The VLAN rules take precedence, and then the traffic segmentation rules are applied.

Command	Parameters
config traffic_segmentation	[<portlist> all] forward_list [null all <portlist>]
show traffic_segmentation	{<portlist>}

Each command is listed, in detail, in the following sections.

config traffic_segmentation	
Purpose	Used to configure traffic segmentation on the Switch.
Syntax	config traffic_segmentation [<portlist> all] forward_list [null all <portlist>]
Description	The config traffic_segmentation command is used to configure traffic segmentation on the Switch.
Parameters	<portlist> – Specifies a port or range of ports that will be configured for traffic segmentation. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) all – Specifies all ports on the Switch. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) forward_list – Specifies a port or range of ports that will receive forwarded frames from the ports specified in the portlist, above. null – No ports are specified all – Specifies all ports on the Switch. <portlist> – Specifies a range of ports for the forwarding list. This list must be on the same switch previously specified for traffic segmentation (i.e. following the <portlist> specified above for config traffic_segmentation). The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure ports 1 through 10 to be able to forward frames to port 11 through 15:

```
DGS-3400:4# config traffic_segmentation 1:1-1:10 forward_list 1:11-1:15
Command: config traffic_segmentation 1:1-1:10 forward_list 1:11-1:15

Success.

DGS-3400:4#
```

show traffic_segmentation

Purpose	Used to display the current traffic segmentation configuration on the Switch.
Syntax	show traffic_segmentation {<portlist>}
Description	The show traffic_segmentation command is used to display the current traffic segmentation configuration on the Switch.
Parameters	<portlist> – Specifies a port or range of ports for which the current traffic segmentation configuration on the Switch will be displayed. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	The port lists for segmentation and the forward list must be on the same Switch.

Example usage:

To display the current traffic segmentation configuration on the Switch.

```
DGS-3400:4#show traffic_segmentation
Command: show traffic_segmentation

Traffic Segmentation Table

Port  Forward Portlist
-----
1:1    1:1-1:24

TIME AND SNTP COMMANDS

The Simple Network Time Protocol (SNTP) (an adaptation of the Network Time Protocol (NTP)) commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config sntp	{primary <ipaddr> secondary <ipaddr> poll-interval <int 30-99999>}
show sntp	
enable sntp	
disable sntp	
config time	<date ddmthyyyy > <time hh:mm:ss >
config time_zone	{operator [+ -] hour <gmt_hour 0-13> min <minute 0-59>}
config dst	[disable repeating {s_week <start_week 1-4,last> s_day <start_day sun-sat> s_mth <start_mth 1-12> s_time <start_time hh:mm> e_week <end_week 1-4,last> e-day <end_day sun-sat> e_mth <end_mth 1-12> e_time <end_time hh:mm> offset [30 60 90 120]} annual {s_date <start_date 1-31> s_mth <start_mth 1-12> s_time <start_time hh:mm> e_date <end_date 1-31> e_mth <end_mth 1-12> e_time <end_time hh:mm> offset [30 60 90 120]}]
show time	

Each command is listed, in detail, in the following sections.

config sntp

Purpose	Used to setup SNTP service.
Syntax	config sntp {primary <ipaddr> secondary <ipaddr> poll-interval <int 30-99999>}
Description	Use this command to configure SNTP service from an SNTP server. SNTP must be enabled for this command to function (See enable sntp).
Parameters	<i>primary</i> – This is the primary server the SNTP information will be taken from. • <i><ipaddr></i> – The IP address of the primary server. <i>secondary</i> – This is the secondary server the SNTP information will be taken from in the event the primary server is unavailable. • <i><ipaddr></i> – The IP address for the secondary server. <i>poll-interval <int 30-99999></i> – This is the interval between requests for updated SNTP information. The polling interval ranges from 30 to 99,999 seconds.
Restrictions	Only administrator-level users can issue this command. SNTP service must be enabled for this command to function (<i>enable sntp</i>).

Example usage:

To configure SNTP settings:

```
DGS-3400:4#config sntp primary 10.1.1.1 secondary 10.1.1.2 poll-interval 30
Command: config sntp primary 10.1.1.1 secondary 10.1.1.2 poll-interval 30

Success.

DGS-3400:4#
```

show sntp

Purpose	Used to display the SNTP information.
Syntax	show sntp
Description	This command will display SNTP settings information including the source IP address, time and poll interval.
Parameters	None.
Restrictions	None.

Example usage:

To display SNTP configuration information:

```
DGS-3400:4#show sntp
Command: show sntp

Current Time Source   : System Clock
SNTP                  : Disabled
SNTP Primary Server   : 10.1.1.1
SNTP Secondary Server : 10.1.1.2
SNTP Poll Interval    : 30 sec

DGS-3400:4#
```

enable sntp

Purpose	To enable SNTP server support.
Syntax	enable sntp
Description	This will enable SNTP support. SNTP service must be separately configured (see config sntp). Enabling and configuring SNTP support will override any manually configured system time settings.
Parameters	None.
Restrictions	Only administrator-level users can issue this command. SNTP settings must be configured for SNTP to function (config sntp).

Example usage:

To enable the SNTP function:

```
DGS-3400:4#enable sntp
Command: enable sntp

Success.

DGS-3400:4#
```

disable sntp

Purpose	To disable SNTP server support.
Syntax	disable sntp
Description	This will disable SNTP support. SNTP service must be separately configured (see config sntp).
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example:

To disable SNTP:

```
DGS-3400:4#disable sntp
```

```
Command: disable sntp
```

```
Success.
```

```
DGS-3400:4#
```

config time

Purpose	Used to manually configure system time and date settings.
Syntax	config time <date ddmthyyyy> <time hh:mm:ss>
Description	This will configure the system time and date settings. These will be overridden if SNTP is configured and enabled.
Parameters	<i>date</i> – Express the date using two numerical characters for the day of the month, three alphabetical characters for the name of the month, and four numerical characters for the year. For example: 03aug2003. <i>time</i> – Express the system time using the format hh:mm:ss, that is, two numerical characters each for the hour using a 24-hour clock, the minute and second. For example: 19:42:30.
Restrictions	Only administrator-level users can issue this command. Manually configured system time and date settings are overridden if SNTP support is enabled.

Example usage:

To manually set system time and date settings:

```
DGS-3400:4#config time 30jun2003 16:30:30
```

```
Command: config time 30jun2003 16:30:30
```

```
Success.
```

```
DGS-3400:4#
```

config time_zone

Purpose	Used to determine the time zone used in order to adjust the system clock.
Syntax	config time_zone {operator [+ -] hour <gmt_hour 0-13> min <minute 0-59>}
Description	This will adjust system clock settings according to the time zone. Time zone settings will adjust SNTP information accordingly.
Parameters	<i>operator</i> – Choose to add (+) or subtract (-) time to adjust for time zone relative to GMT. <i>hour</i> – Select the number of hours different from GMT. <i>min</i> – Select the number of minutes difference added or subtracted to adjust the time zone.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure time zone settings:

DGS-3400:4#config time_zone operator + hour 2 min 30

Command: config time_zone operator + hour 2 min 30

Success.

DGS-3400:4#

config dst

Purpose	Used to enable and configure time adjustments to allow for the use of Daylight Savings Time (DST).
Syntax	config dst [disable repeating {s_week <start_week 1-4,last> s_day <start_day sun-sat> s_mth <start_mth 1-12> s_time start_time hh:mm> e_week <end_week 1-4,last> e_day <end_day sun-sat> e_mth <end_mth 1-12> e_time <end_time hh:mm> offset [30 60 90 120]} annual {s_date start_date 1-31> s_mth <start_mth 1-12> s_time <start_time hh:mm> e_date <end_date 1-31> e_mth <end_mth 1-12> e_time <end_time hh:mm> offset [30 60 90 120]}]
Description	DST can be enabled and configured using this command. When enabled this will adjust the system clock to comply with any DST requirement. DST adjustment effects system time for both manually configured time and time set using SNTP service. <i>disable</i> - Disable the DST seasonal time adjustment for the Switch. <i>repeating</i> - Using repeating mode will enable DST seasonal time adjustment. Repeating mode requires that the DST beginning and ending date be specified using a formula. For example, specify to begin DST on Saturday during the second week of April and end DST on Sunday during the last week of October. <i>annual</i> - Using annual mode will enable DST seasonal time adjustment. Annual mode requires that the DST beginning and ending date be specified concisely. For example, specify to begin DST on April 3 and end DST on October 14. <i>s_week</i> - Configure the week of the month in which DST begins. • <i><start_week 1-4,last></i> - The number of the week during the month in which DST begins where 1 is the first week, 2 is the second week and so on, last is the last week of the month. <i>e_week</i> - Configure the week of the month in which DST ends. • <i><end_week 1-4,last></i> - The number of the week during the month in which DST ends where 1 is the first week, 2 is the second week and so on, last is the last week of the month. <i>s_day</i> - Configure the day of the week in which DST begins. • <i><start_day sun-sat></i> - The day of the week in which DST begins expressed using a three character abbreviation (sun, mon, tue, wed, thu, fri, sat) <i>e_day</i> - Configure the day of the week in which DST ends. • <i><end_day sun-sat></i> - The day of the week in which DST ends expressed using a three character abbreviation (sun, mon, tue, wed, thu, fri, sat) <i>s_mth</i> - Configure the month in which DST begins. • <i><start_mth 1-12></i> - The month to begin DST expressed as a number. <i>e_mth</i> - Configure the month in which DST ends. • <i><end_mth 1-12></i> - The month to end DST expressed as a number. <i>s_time</i> - Configure the time of day to begin DST. • <i><start_time hh:mm></i> - Time is expressed using a 24-hour clock, in hours and minutes. <i>e_time</i> - Configure the time of day to end DST. • <i><end_time hh:mm></i> - Time is expressed using a 24-hour clock, in hours and minutes. <i>s_date</i> - Configure the specific date (day of the month) to begin DST. • <i><start_date 1-31></i> - The start date is expressed numerically.

config dst

Parameters **e_date** - Configure the specific date (day of the month) to begin DST.

- **<end_date 1-31>** - The end date is expressed numerically.

offset [30 | 60 | 90 | 120] - Indicates number of minutes to add or to subtract during the summertime. The possible offset times are 30,60,90,120. The default value is 60.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure daylight savings time on the Switch:

```
DGS-3400:4#config dst repeating s_week 2 s_day tue s_mth 4 s_time 15:00 e_week 2 e_day
wed e_mth 10 e_time 15:30 offset 30
```

```
Command: config dst repeating s_week 2 s_day tue s_mth 4 s_time 15:00 e_week 2 e_day
wed e_mth 10 e_time 15:30 offset 30
```

Success.

```
DGS-3400:4#
```

show time

Purpose	Used to display the current time settings and status.
Syntax	show time
Description	This will display system time and date configuration as well as display current system time.
Parameters	None.
Restrictions	None.

Example usage:

To show the time currently set on the Switch's System clock:

```
DGS-3400:4#show time
Command: show time

Current Time Source : System Clock
Boot Time          : 4 May 2006 10:21:22
Current Time       : 4 May 2006 15:01:32
Time Zone          : GMT +02:30
Daylight Saving Time : Repeating
Offset in Minutes   : 30
  Repeating From     : Apr 2nd Tue 15:00
                   To       : Oct 2nd Wed 15:30
  Annual From       : 29 Apr 00:00
                   To       : 12 Oct 00:00
```

```
DGS-3400:4#
```

DHCP RELAY

The DHCP relay commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config dhcp_relay	{hops <value 1-16> time <sec 0-65535>}
config dhcp_relay add ipif	<ipif_name 12> <ipaddr>
config dhcp_relay delete ipif	<ipif_name 12> <ipaddr>
config dhcp_relay option_82 state	[enable disable]
config dhcp_relay option_82 check	[enable disable]
config dhcp_relay option_82 policy	[replace drop keep]
show dhcp_relay	{ipif <ipif_name 12>}
enable dhcp_relay	
disable dhcp_relay	

Each command is listed in detail in the following sections.

config dhcp_relay

Purpose	Used to configure the DHCP/BOOTP relay feature of the switch.
Syntax	config dhcp_relay {hops <value 1-16> time <sec 0-65535>}
Description	This command is used to configure the DHCP/BOOTP relay feature.
Parameters	<i>hops <value 1-16></i> Specifies the maximum number of relay agent hops that the DHCP packets can cross. <i>time <sec 0-65535></i> If this time is exceeded, the Switch will relay the DHCP packet.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To config DHCP relay:

```
DGS-3$00:4#config dhcp_relay hops 2 time 23
Command: config dhcp_relay hops 2 time 23

Success.

DGS-3400:4#
```

config dhcp_relay add ipif

Purpose	Used to add an IP destination address to the switch's DHCP/BOOTP relay table.
Syntax	config dhcp_relay add ipif <ipif_name 12> <ipaddr>
Description	This command adds an IP address as a destination to forward (relay) DHCP/BOOTP relay packets to.
Parameters	<i><ipif_name 12></i> The name of the IP interface in which DHCP relay is to be enabled. <i><ipaddr></i> The DHCP server IP address.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To add an IP destination to the DHCP relay table:

```
DGS-3400:4#config dhcp_relay add ipif System 10.58.44.6
Command: config dhcp_relay add ipif System 10.58.44.6

Success.

DGS-3400:4#
```

config dhcp_relay delete ipif

Purpose	Used to delete an IP destination addresses from the Switch's DHCP/BOOTP relay table.
Syntax	config dhcp_relay delete ipif <ipif_name 12> <ipaddr>
Description	This command is used to delete an IP destination addresses in the Switch's DHCP/BOOTP relay table.
Parameters	<ipif_name 12> The name of the IP interface that contains the IP address below. <ipaddr> The DHCP server IP address.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete an IP destination from the DHCP relay table:

```
DGS-3400:4#config dhcp_relay delete ipif System 10.58.44.6
Command: config dhcp_relay delete ipif System 10.58.44.6

Success.

DGS-3400:4#
```

config dhcp_relay option_82 state

Purpose	Used to configure the state of DHCP relay agent information option 82 of the switch.
Syntax	config dhcp_relay option_82 state [enable disable]
Description	This command is used to configure the state of DHCP relay agent information option 82 of the switch.
Parameters	enable - When this field is toggled to <i>Enabled</i> the relay agent will insert and remove DHCP relay information (option 82 field) in messages between DHCP server and client. When the relay agent receives the DHCP request, it adds the option 82 information, and the IP address of the relay agent (if the relay agent is configured), to the packet. Once the option 82 information has been added to the packet it is sent on to the DHCP server. When the DHCP server receives the packet, if the server is capable of option 82, it can implement policies like restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option 82 field in the DHCP reply. The DHCP server unicasts the reply to the back to the relay agent if the request was relayed to the server by the relay agent. The switch verifies that it originally inserted the option 82 data. Finally, the relay agent removes the option 82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request. disable - If the field is toggled to <i>disable</i> the relay agent will not insert and remove DHCP relay information (option 82 field) in messages between DHCP servers and clients, and the check and policy settings will have no effect.

config dhcp_relay option_82 state

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure DHCP relay option 82 state:

```
DGS-3400:4#config dhcp_relay option_82 state enable
Command: config dhcp_relay option_82 state enable

Success.

DGS-3400:4#
```

config dhcp_relay option_82 check

Purpose	Used to configure the checking mechanism of DHCP relay agent information option 82 of the switch.
Syntax	config dhcp_relay option_82 check [enable disable]
Description	This command is used to configure the checking mechanism of DHCP/BOOTP relay agent information option 82 of the switch.
Parameters	<i>enable</i> – When the field is toggled to <i>enable</i>, the relay agent will check the validity of the packet's option 82 field. If the switch receives a packet that contains the option 82 field from a DHCP client, the switch drops the packet because it is invalid. In packets received from DHCP servers, the relay agent will drop invalid messages. <i>disable</i> - When the field is toggled to <i>disable</i>, the relay agent will not check the validity of the packet's option 82 field.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure DHCP relay option 82 check:

```
DGS-3400:4#config dhcp_relay option_82 check enable
Command: config dhcp_relay option_82 check enable

Success.

DGS-3400:4#
```

config dhcp_relay option_82 policy

Purpose	Used to configure the reforwarding policy of relay agent information option 82 of the switch.
Syntax	config dhcp_relay option_82 policy [replace drop keep]
Description	This command is used to configure the reforwarding policy of DHCP relay agent information option 82 of the switch.
Parameters	<i>replace</i> - The option 82 field will be replaced if the option 82 field already exists in the packet received from the DHCP client. <i>drop</i> - The packet will be dropped if the option 82 field already exists in the packet received from the DHCP client. <i>keep</i> - The option 82 field will be retained if the option 82 field already exists in the packet received from the DHCP client.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure DHCP relay option 82 policy:

```
DGS-3400:4#config dhcp_relay option_82 policy replace
Command: config dhcp_relay option_82 policy replace

Success.

DGS-3400:4#
```

show dhcp_relay

Purpose	Used to display the current DHCP/BOOTP relay configuration.
Syntax	show dhcp_relay {ipif <ipif_name 12>}
Description	This command will display the current DHCP relay configuration for the Switch, or if an IP interface name is specified, the DHCP relay configuration for that IP interface.
Parameters	<i>ipif <ipif_name 12></i> - The name of the IP interface for which to display the current DHCP relay configuration.
Restrictions	None.

Example usage:

To show the DHCP relay configuration:

```
DGS-3400:4#show dhcp_relay
Command: show dhcp_relay

DHCP/BOOTP Relay Status           : Enabled
DHCP/BOOTP Hops Count Limit       : 2
DHCP/BOOTP Relay Time Threshold   : 23
DHCP Relay Agent Information Option 82 State : Enabled
DHCP Relay Agent Information Option 82 Check : Enabled
DHCP Relay Agent Information Option 82 Policy : Replace

Interface  Server 1  Server 2  Server 3  Server 4
-----
System     10.58.44.6

DGS-3400:4#
```

Example usage:

To show a single IP destination of the DHCP relay configuration:

```
DGS-3400:4#show dhcp_relay ipif System
Command: show dhcp_relay ipif System

DHCP/BOOTP Relay Status           : Enabled
DHCP/BOOTP Hops Count Limit       : 2
DHCP/BOOTP Relay Time Threshold   : 23
DHCP Relay Agent Information Option 82 State : Enabled
DHCP Relay Agent Information Option 82 Check : Enabled
DHCP Relay Agent Information Option 82 Policy : Replace

Interface  Server 1  Server 2  Server 3  Server 4
-----
System     10.58.44.6

DGS-3400:4#
```

enable dhcp_relay

Purpose	Used to enable the DHCP/BOOTP relay function on the Switch.
Syntax	enable dhcp_relay
Description	This command is used to enable the DHCP/BOOTP relay function on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable DHCP relay:

```
DGS-3400:4#enable dhcp_relay
Command: enable dhcp_relay

Success.

DGS-3400:4#
```

disable dhcp_relay

Purpose	Used to disable the DHCP/BOOTP relay function on the Switch.
Syntax	disable dhcp_relay
Description	This command is used to disable the DHCP/BOOTP relay function on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable DHCP relay:

```
DGS-3400:4#disable dhcp_relay
Command: disable dhcp_relay

Success.

DGS-3400:4#
```

ARP COMMANDS

The ARP commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create arpentry	<ipaddr> <macaddr>
delete arpentry	[<ipaddr> all]
show arpentry	{ipif <ipif_name 12> ipaddress <ipaddr> static}
config arp_aging time	<value 0-65535>
clear arptable	
config arpentry	<ipaddr> <macaddr>

Each command is listed, in detail, in the following sections.

create arpentry

Purpose	Used to make a static entry into the ARP table.
Syntax	create arpentry <ipaddr> <macaddr>
Description	This command is used to enter an IP address and the corresponding MAC address into the Switch's ARP table.
Parameters	<ipaddr> – The IP address of the end node or station. <macaddr> – The MAC address corresponding to the IP address above.
Restrictions	Only administrator-level users can issue this command. The Switch supports up to 255 static ARP entries.

Example Usage:

To create a static ARP entry for the IP address 10.48.74.121 and MAC address 00:50:BA:00:07:36:

```
DGS-3400:4#create arpentry 10.48.74.121 00-50-BA-00-07-36
Command: create arpentry 10.48.74.121 00-50-BA-00-07-36

Success.

DGS-3400:4#
```

delete arpentry

Purpose	Used to delete a static entry into the ARP table.
Syntax	delete arpentry [{<ipaddr> all}]
Description	This command is used to delete a static ARP entry, made using the create arpentry command above, by specifying either the IP address of the entry or all. Specifying <i>all</i> clears the Switch's ARP table.
Parameters	<ipaddr> – The IP address of the end node or station. <i>all</i> – Deletes all ARP entries.
Restrictions	Only administrator-level users can issue this command.

Example Usage:

To delete an entry of IP address 10.48.74.121.125 from the ARP table:

```
DGS-3400:4#delete arpentry 10.48.74.121
Command: delete arpentry 10.48.74.121

Success.

DGS-3400:4#
```

config arp_aging time

Purpose	Used to configure the age-out timer for ARP table entries on the Switch.
Syntax	config arp_aging time <value 0-65535>
Description	This command sets the maximum amount of time, in minutes, that an ARP entry can remain in the Switch's ARP table, without being accessed, before it is dropped from the table.
Parameters	<i>time <value 0-65535></i> – The ARP age-out time, in minutes. The value may be set in the range of 0-65535 minutes with a default setting of 20 minutes.
Restrictions	Only administrator-level users can issue this command.

Example Usage:

To configure ARP aging time:

```
DGS-3400:4#config arp_aging time 30
Command: config arp_aging time 30

Success.

DGS-3400:4#
```

show arpentry

Purpose	Used to display the ARP table.
Syntax	show arpentry {ipif <ipif_name 12> ipaddress <ipaddr> static}
Description	This command is used to display the current contents of the Switch's ARP table.
Parameters	<i>ipif <ipif_name 12></i> – The name of the IP interface the end node or station for which the ARP table entry was made, resides on. <i>ipaddress <ipaddr></i> – The network address corresponding to the IP interface name above. <i>static</i> – Displays the static entries in the ARP table.
Restrictions	None.

Example usage:

To display the ARP table:

DGS-3400:4#show arpentry

Command: show arpentry

ARP Aging Time : 30

Interface	IP Address	MAC Address	Type
System	10.0.0.0	FF-FF-FF-FF-FF-FF	Local/Broadcast
System	10.1.1.169	00-50-BA-70-E4-4E	Dynamic
System	10.1.1.254	00-01-30-FA-5F-00	Dynamic

Total Entries = 20

DGS-3400:4#

clear arptable

Purpose	Used to remove all dynamic ARP table entries.
Syntax	clear arptable
Description	This command is used to remove dynamic ARP table entries from the Switch's ARP table. Static ARP table entries are not affected.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To remove dynamic entries in the ARP table:

DGS-3400:4#clear arptable

Command: clear arptable

Success.

DGS-3400:4#

config arpentry

Purpose	Used to configure a static entry in the ARP table.
Syntax	config arpentry <ipaddr> <macaddr>
Description	This command is used to configure a static entry in the ARP Table. The user may specify the IP address and the corresponding MAC address of an entry in the Switch's ARP table.
Parameters	<ipaddr> – The IP address of the end node or station. <macaddr> – The MAC address corresponding to the IP address above.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure a static ARP entry for the IP address 10.48.74.12 and MAC address 00:50:BA:00:07:36:

```
DGS-3400:4#config arpentry 10.48.74.12 00-50-BA-00-07-36
Command: config arpentry 10.48.74.12 00-50-BA-00-07-36
```

```
Success.
```

```
DGS-3400:4#
```

ROUTING TABLE COMMANDS

The Switch supports only static routing for IP and IPv6 formatted addressing. Users can create up to 128 static route entries for IPv4 and IPv6 combined. Only manually configured static routes can route IP packets, which means the local route cannot route IP packets. For each device that is a part of the DGS-3400 network, users may only configure one IP address as a static route.

For IPv4 static routes, once a static route has been set, the Switch will send an ARP request packet to the next hop router that has been set by the user. Once an ARP response has been retrieved by the switch from that next hop, the route becomes enabled. If a response is not received from the next hop device after three ARP requests have been set, the configured static route will remain in a link-down status.

The Switch also supports a floating static route, which means that the user may create an alternative static route to a different next hop device located in the same network. This secondary next hop device route is considered as a backup static route for when the primary static route is down. If the primary route is lost, the backup route will uplink and its status will become Active.

The routing table commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
create iproute	<network_address> <ipaddr> {<metric 1-65535>} {[primary backup]}
create iproute default	<ipaddr> {<metric 1-65535>}
delete iproute default	
delete iproute	<network_address> <ipaddr> {[primary backup]}
show iproute	{<network_address>} {static}
create iproute ipv6	[<ipif_name 12> <ipv6networkaddr> <ipv6addr> {<metric 1-65535>} <ipv6networkaddr> <ipv6addr> {<metric 1-65535>}]
delete iproute ipv6	{<ipv6networkaddr> <ipv6addr> all}
show iproute ipv6	{<ipv6networkaddr>}
create iproute ipv6 default	[<ipif_name 12> <ipv6addr> {<metric 1-65535>} <ipv6addr> {<metric 1-65535>}]
delete iproute ipv6 default	

Each command is listed, in detail, in the following sections.

create iproute

Purpose	Used to create IP route entries to the Switch's IP routing table.
Syntax	create iproute <network_address> <ipaddr> {<metric 1-65535>} {[primary backup]}
Description	This command is used to create a primary and backup IP route entry to the Switch's IP routing table.
Parameters	<network_address> – IP address and netmask of the IP interface that is the destination of the route. The address and mask information can be specified using the traditional format (for example, 10.1.2.3/255.0.0.0 or in CIDR format, 10.1.2.3/8). <ipaddr> – The gateway IP address for the next hop router. <metric 1-65535> – Allows the entry of a routing protocol metric entry, representing the number of routers between the Switch and the IP address above. The default setting is 1. [primary backup] - The user may choose between Primary and Backup. If the Primary Static Route fails, the Backup Route will support the entry. Please take note that the Primary and Backup entries cannot have the same Gateway.

create iproute

Restrictions	Only administrator-level users can issue this command.
--------------	--

Example usage:

To add a single static address 10.48.74.121, mask 255.0.0.0 and gateway 10.1.1.254 to the routing table:

NOTE: Users must manually configure static ARP settings for hosts connected to the Switch, because the Switch cannot automatically learn host IP addresses.

```
DGS-3400:4#create iproute 10.48.74.121/255.0.0.0 10.1.1.254 1
```

```
Command: create iproute 10.48.74.121/8 10.1.1.254 1
```

```
Success.
```

```
DGS-3400:4#
```

create iproute default

Purpose	Used to create IP route entries to the Switch's IP routing table.
Syntax	create iproute default <ipaddr> {<metric>}
Description	This command is used to create a default static IP route entry to the Switch's IP routing table.
Parameters	<ipaddr> – The gateway IP address for the next hop router. <metric> – Allows the entry of a routing protocol metric entry representing the number of routers between the Switch and the IP address above. The default setting is 1.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To add the default static address 10.48.74.121, with a metric setting of 1, to the routing table:

```
DGS-3400:4#create iproute default 10.48.74.121 1
```

```
Command: create iproute default 10.48.74.121 1
```

```
Success.
```

```
DGS-3400:4#
```

delete iproute

Purpose	Used to delete an IP route entry from the Switch's IP routing table.
Syntax	delete iproute <network_address> <ipaddr> [primary backup]
Description	This command will delete an existing entry from the Switch's IP routing table.
Parameters	<network_address> – IP address and netmask of the IP interface that is the destination of the route. The address and mask information can be specified using the traditional format (for example, 10.1.2.3/255.0.0.0 or in CIDR format, 10.1.2.3/8). <ipaddr> – The gateway IP address for the next hop router.

delete iproute

[primary | backup] – The user may choose between Primary and Backup. If the Primary Static Route fails, the Backup Route will support the entry. Please take note that the Primary and Backup entries cannot have the same Gateway.

Restrictions Only administrator-level users can issue this command.

Example usage:

To delete a backup static address 10.48.75.121, mask 255.0.0.0 and gateway (ipaddr) entry of 10.1.1.254 from the routing table:

```
DGS-3400:4#delete iproute 10.48.74.121/8 10.1.1.254
Command: delete iproute 10.48.74.121/8 10.1.1.254
```

Success.

```
DGS-3400:4#
```

delete iproute default

Purpose Used to delete a default IP route entry from the Switch's IP routing table.

Syntax **delete iproute default**

Description This command will delete an existing default entry from the Switch's IP routing table.

Parameters None.

Restrictions Only administrator-level users can issue this command.

Example usage:

To delete the default IP route:

```
DGS-3400:4#delete iproute default
Command: delete iproute default
```

Success.

```
DGS-3400:4#
```

show iproute

Purpose Used to display the Switch's current IP routing table.

Syntax **show iproute {<network_address>} {static}**

Description This command will display the Switch's current IP routing table.

Parameters <network_address> – IP address and netmask of the IP interface that is the destination of the route. The address and mask information can be specified using the traditional format (for example, 10.1.2.3/255.0.0.0 or in CIDR format, 10.1.2.3/8).
{static} – Add this parameter to display all statically configured IP routes set on the switch.

show iproute

Restrictions	None.
--------------	-------

Example usage:

To display the contents of the IP routing table:

```
DGS-3400:4#show iproute
Command: show iproute

Routing Table

IP Address/Netmask  Gateway    Interface  Cost  Protocol
-----
10.0.0.0/8          0.0.0.0    System     1     Local

Total Entries : 1

DGS-3400:4#
```

create iproute ipv6

Purpose	Used to create Ipv6 route entries to the Switch's IP routing table.
Syntax	create iproute ipv6 [<ipif_name 12> <ipv6networkaddr> <ipv6addr> {<metric 1-65535>} <ipv6networkaddr> <ipv6addr> {<metric 1-65535>}]
Description	This command is used to create a primary and backup IP route entry to the Switch's IP routing table.
Parameters	<ipif_name 12>- Enter the IP interface name for which to create a static route. Configuring this command without this parameter will set the static route for the System IP interface. <ipv6networkaddr> – IPv6 address and netmask of the IP interface that is the destination of the route. Specify the address and mask information using the format as ipv6address / prefix_length (ipv6address is hexadecimal number, prefix length is decimal number, for example 1234::5D7F/32). <ipv6addr> – IPv6 address for the next hop router. <metric 1-65535> – Allows the entry of a routing protocol metric entry, representing the number of routers between the Switch and the IP address above. The default setting is 1.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To add a single static IPv6 entry in IPv6 format:

```
DGS-3400:4# create iproute ipv6 1234::5D7F/32 2D30::AC21
Command: create iproute ipv6 1234::5D7F/32 2D30::AC21

Success.

DGS-3400:4#
```

delete iproute ipv6

Purpose	Used to delete an static IPv6 route entry from the Switch's IP routing table.
Syntax	delete iproute ipv6 {<ipv6networkaddr> <ipv6addr> all}

delete iproute ipv6

Description	This command will delete an existing static IPv6 entry from the Switch's IP routing table.
Parameters	<ipv6networkaddr> – IPv6 address and netmask of the IP interface that is the destination of the route. Specify the address and mask information using the format as ipv6address / prefix_length (ipv6address is hexadecimal number, prefix length is decimal number, for example 1234::5D7F/32). <ipv6addr> – IPv6 address for the next hop router. all – This will delete all IPv6 static entries for the destination and next hop.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a static IPv6 entry from the routing table:

```
DGS-3400:4# delete iproute ipv6 1234::5D7F/32 2D30::AC21
Command: delete iproute ipv6 1234::5D7F/32 2D30::AC21

Success.

DGS-3400:4#
```

show iproute ipv6

Purpose	Used to display the Switch's current static IPv6 routing table or a specified IPv6 address.
Syntax	show iproute ipv6 {<ipv6networkaddr>}
Description	This command will display the Switch's current static IPv6 routing table or a specific IPv6 entry.
Parameters	<ipv6networkaddr> – IPv6 address and netmask of the IP interface that is the destination of the route. Specify the address and mask information using the format as ipv6address / prefix_length (ipv6address is hexadecimal number, prefix length is decimal number, for example 1234::5D7F/32).
Restrictions	None.

Example usage:

To display the static IPv6 entries in the routing table:

```
DGS-3400:4# show iproute ipv6
Command: show iproute ipv6

Routing Table

IPv6 Address/Netmask      Gateway                Cost    Protocol
-----
1234::/32                 2D30::AC21            1       Static

Total Entries: 1

DGS-3400:4#
```

create iproute ipv6 default

create iproute ipv6 default

Purpose	Used to create IP route entries to the Switch's IP routing table.
Syntax	create iproute ipv6 default [<ipif_name 12> <ipv6addr> {<metric 1-65535>} <ipv6addr> {<metric 1-65535>}]
Description	This command is used to create a default static IPv6 route entry to the Switch's IP routing table.
Parameters	<ipif_name 12>- Enter the IP interface name for which to create a static route. Configuring this command without this parameter will set the static route for the System IP interface. <ipv6addr> – The gateway IPv6 address for the next hop router. <metric 1-65535> – Allows the entry of a routing protocol metric entry representing the number of routers between the Switch and the IP address above. The default setting is 1.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To add the default static address 1234::5D7F/32, with a metric setting of 1, to the routing table:

```
DGS-3400:4#create iproute ipv6 default 1234::5D7F/32 metric 1
Command: create iproute ipv6 default 1234::5D7F/32 metric 1

Success.

DGS-3400:4#
```

delete iproute ipv6 default

Purpose	Used to delete a default IPv6 route entry from the Switch's IP routing table.
Syntax	delete iproute ipv6 default
Description	This command will delete an existing default entry from the Switch's IP routing table.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the default IPv6 route:

```
DGS-3400:4#delete iproute ipv6 default
Command: delete iproute ipv6 default

Success.

DGS-3400:4#
```

MAC NOTIFICATION COMMANDS

The MAC notification commands in the Command Line Interface (CLI) are listed, in the following table, along with their appropriate parameters.

Command	Parameters
enable mac_notification	
disable mac_notification	
config mac_notification	{interval <int 1-2147483647> historysize <int 1-500>}
config mac_notification ports	[<portlist> all] [enable disable]
show mac_notification	
show mac_notification ports	<portlist>

Each command is listed, in detail, in the following sections.

enable mac_notification

Purpose	Used to enable global MAC address table notification on the Switch.
Syntax	enable mac_notification
Description	This command is used to enable MAC address notification without changing configuration.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example Usage:

To enable MAC notification without changing basic configuration:

```
DGS-3400:4#enable mac_notification
Command: enable mac_notification

Success.

DGS-3400:4#
```

disable mac_notification

Purpose	Used to disable global MAC address table notification on the Switch.
Syntax	disable mac_notification
Description	This command is used to disable MAC address notification without changing configuration.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example Usage:

To disable MAC notification without changing basic configuration:

DGS-3400:4#disable mac_notification

Command: disable mac_notification

Success.

DGS-3400:4#

config mac_notification

Purpose	Used to configure MAC address notification.
Syntax	config mac_notification {interval <int 1-2147483647> historysize <int 1-500>}
Description	MAC address notification is used to monitor MAC addresses learned and entered into the FDB.
Parameters	<i>interval</i> <sec 1-2147483647> - The time in seconds between notifications. The user may choose an interval between 1 and 2,147,483,647 seconds. <i>historysize</i> <1-500> - The maximum number of entries listed in the history log used for notification.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the Switch's MAC address table notification global settings:

DGS-3400:4#config mac_notification interval 1 historysize 500

Command: config mac_notification interval 1 historysize 500

Success.

DGS-3400:4#

config mac_notification ports

Purpose	Used to configure MAC address notification status settings.
Syntax	config mac_notification ports [<portlist all] [enable disable]
Description	MAC address notification is used to monitor MAC addresses learned and entered into the FDB.
Parameters	<i><portlist></i> - Specify a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) <i>all</i> – Entering this command will set all ports on the system. <i>[enable disable]</i> – These commands will enable or disable MAC address table notification on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable port 7 for MAC address table notification:

```
DGS-3400:4#config mac_notification ports 1:7 enable
```

```
Command: config mac_notification ports 1:7 enable
```

```
Success.
```

```
DGS-3400:4#
```

show mac_notification

Purpose	Used to display the Switch's MAC address table notification global settings
Syntax	show mac_notification
Description	This command is used to display the Switch's MAC address table notification global settings.
Parameters	None.
Restrictions	None.

Example usage:

To view the Switch's MAC address table notification global settings:

```
DGS-3400:4#show mac_notification
```

```
Command: show mac_notification
```

Global MAC Notification Settings

```
State      : Enabled
```

```
Interval   : 1
```

```
History Size : 1
```

```
DGS-3400:4#
```

show mac_notification ports

Purpose	Used to display the Switch's MAC address table notification status settings
Syntax	show mac_notification ports <portlist>
Description	This command is used to display the Switch's MAC address table notification status settings.
Parameters	<portlist> - Specify a port or range of ports to be configured. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9) Entering this command without the parameter will display the MAC notification table for all ports.
Restrictions	None

Example usage:

To display all port's MAC address table notification status settings:

DGS-3400:4#show mac_notification ports

Command: show mac_notification ports

Port # MAC Address Table Notification State

Port #	MAC Address Table Notification State

ACCESS AUTHENTICATION CONTROL COMMANDS

The TACACS / XTACACS / TACACS+ / RADIUS commands allows users secure access to the Switch using the TACACS / XTACACS / TACACS+ / RADIUS protocols. When a user logs in to the Switch or tries to access the administrator level privilege, he or she is prompted for a password. If TACACS / XTACACS / TACACS+ / RADIUS authentication is enabled on the Switch, it will contact a TACACS / XTACACS / TACACS+ / RADIUS server to verify the user. If the user is verified, he or she is granted access to the Switch.

There are currently three versions of the TACACS security protocol, each a separate entity. The Switch's software supports the following versions of TACACS:

- TACACS (Terminal Access Controller Access Control System) —Provides password checking and authentication, and notification of user actions for security purposes utilizing via one or more centralized TACACS servers, utilizing the UDP protocol for packet transmission.
- Extended TACACS (XTACACS) — An extension of the TACACS protocol with the ability to provide more types of authentication requests and more types of response codes than TACACS. This protocol also uses UDP to transmit packets.
- TACACS+ (Terminal Access Controller Access Control System plus) — Provides detailed access control for authentication for network devices. TACACS+ is facilitated through Authentication commands via one or more centralized servers. The TACACS+ protocol encrypts all traffic between the Switch and the TACACS+ daemon, using the TCP protocol to ensure reliable delivery.

The Switch also supports the RADIUS protocol for authentication using the Access Authentication Control commands. RADIUS or Remote Authentication Dial In User Server also uses a remote server for authentication and can be responsible for receiving user connection requests, authenticating the user and returning all configuration information necessary for the client to deliver service through the user. RADIUS may be facilitated on this Switch using the commands listed in this section.

In order for the TACACS / XTACACS / TACACS+ / RADIUS security function to work properly, a TACACS / XTACACS / TACACS+ / RADIUS server must be configured on a device other than the Switch, called a *server host* and it must include usernames and passwords for authentication. When the user is prompted by the Switch to enter usernames and passwords for authentication, the Switch contacts the TACACS / XTACACS / TACACS+ / RADIUS server to verify, and the server will respond with one of three messages:

- The server verifies the username and password, and the user is granted normal user privileges on the Switch.
- The server will not accept the username and password and the user is denied access to the Switch.
- The server doesn't respond to the verification query. At this point, the Switch receives the timeout from the server and then moves to the next method of verification configured in the method list.

The Switch has four built-in *server groups*, one for each of the TACACS, XTACACS, TACACS+ and RADIUS protocols. These built-in *server groups* are used to authenticate users trying to access the Switch. The users will set *server hosts* in a preferable order in the built-in *server group* and when a user tries to gain access to the Switch, the Switch will ask the first *server host* for authentication. If no authentication is made, the second *server host* in the list will be queried, and so on. The built-in *server group* can only have hosts that are running the specified protocol. For example, the TACACS *server group* can only have TACACS *server hosts*.

The administrator for the Switch may set up 5 different authentication techniques per user-defined *method list* (TACACS / XTACACS / TACACS+ / RADIUS / local / none) for authentication. These techniques will be listed in an order preferable, and defined by the user for normal user authentication on the Switch, and may contain up to eight authentication techniques. When a user attempts to access the Switch, the Switch will select the first technique listed for authentication. If the first technique goes through its *server hosts* and no authentication is returned, the Switch will then go to the next technique listed in the server group for authentication, until the authentication has been verified or denied, or the list is exhausted.

Please note that user granted access to the Switch will be granted normal user privileges on the Switch. To gain access to admin level privileges, the user must enter the *enable admin* command and then enter a password, which was previously configured by the administrator of the Switch.

NOTE: TACACS, XTACACS and TACACS+ are separate entities and are not compatible. The Switch and the server must be configured exactly the same, using the same protocol. (For example, if the Switch is set up for TACACS authentication, so must be the host server.)

The Access Authentication Control commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable authen_policy	
disable authen_policy	
show authen_policy	
create authen_login method_list_name	<string 15>
config authen_login	[default method_list_name <string 15>] method {tacacs xtacacs tacacs+ radius server_group <string 15> local none}
delete authen_login method_list_name	<string 15>
show authen_login	{default method_list_name <string 15> all}
create authen_enable method_list_name	<string 15>
config authen_enable	[default method_list_name <string 15>] method {tacacs xtacacs tacacs+ radius server_group <string 15> local_enable none}
delete authen_enable method_list_name	<string 15>
show authen_enable	[default method_list_name <string 15> all]
config authen application	{console telnet ssh http all} [login enable] [default method_list_name <string 15>]

Each command is listed, in detail, in the following sections.

enable authn_policy

Purpose	Used to enable system access authentication policy.
Syntax	enable authn_policy
Description	This command will enable an administrator-defined authentication policy for users trying to access the Switch. When enabled, the device will check the method list and choose a technique for user authentication upon login.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable the system access authentication policy:

```
DGS-3400:4#enable authn_policy
Command: enable authn_policy
```

Success.

```
DGS-3400:4#
```

disable authn_policy

Purpose	Used to disable system access authentication policy.
Syntax	disable authn_policy
Description	This command will disable the administrator-defined authentication policy for users trying to access the Switch. When disabled, the Switch will access the local user account database for username and password verification. In addition, the Switch will now accept the local enable password as the authentication for normal users attempting to access administrator level privileges.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the system access authentication policy:

```
DGS-3400:4#disable authn_policy
Command: disable authn_policy
```

Success.

```
DGS-3400:4#
```

show authn_policy

Purpose	Used to display the system access authentication policy status on the Switch.
Syntax	show authn_policy
Description	This command will show the current status of the access authentication policy on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To display the system access authentication policy:

```
DGS-3400:4#show authen_policy
Command: show authen_policy

Authentication Policy: Enabled

DGS-3400:4#
```

create authen_login method_list_name

Purpose	Used to create a user defined method list of authentication methods for users logging on to the Switch.
Syntax	create authen_login method_list_name <string 15>
Description	This command is used to create a list for authentication techniques for user login. The Switch can support up to eight method lists, but one is reserved as a default and cannot be deleted. Multiple method lists must be created and configured separately.
Parameters	<string 15> - Enter an alphanumeric string of up to 15 characters to define the given <i>method list</i> .
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create the method list “Trinity.”:

```
DGS-3400:4#create authen_login method_list_name Trinity
Command: create authen_login method_list_name Trinity

Success.

DGS-3400:4#
```

config authen_login

Purpose	Used to configure a user-defined or default <i>method list</i> of authentication methods for user login.
Syntax	config authen_login [default method_list_name <string 15>] method {tacacs xtacacs tacacs+ radius server_group <string 15> local none}
Description	This command will configure a user-defined or default <i>method list</i> of authentication methods for users logging on to the Switch. The sequence of methods implemented in this command will affect the authentication result. For example, if a user enters a sequence of methods like <i>tacacs – xtacacs – local</i>, the Switch will send an authentication request to the first <i>tacacs</i> host in the server group. If no response comes from the server host, the Switch will send an authentication request to the second <i>tacacs</i> host in the server group and so on, until the list is exhausted. At that point, the Switch will restart the same sequence with the following protocol listed, <i>xtacacs</i>. If no authentication takes place using the <i>xtacacs</i> list, the <i>local</i> account database set in the Switch is used to authenticate the user. When the local method is used, the privilege level will be dependant on the local account privilege configured on the Switch. Successful login using any of these methods will give the user a “user” privilege only. If the user wishes to upgrade his or her status to the administrator level, the user must implement the <i>enable admin</i> command, followed by a previously configured password. (See the enable admin part of this section for more detailed information, concerning the enable admin command.)

config_authen_login

Parameters	<i>default</i> – The default method list for access authentication, as defined by the user. The user may choose one or a combination of up to four(4) of the following authentication methods: ▪ <i>tacacs</i> – Adding this parameter will require the user to be authenticated using the TACACS protocol from the remote TACACS <i>server hosts</i> of the TACACS <i>server group</i> list. ▪ <i>xtacacs</i> – Adding this parameter will require the user to be authenticated using the XTACACS protocol from the remote XTACACS <i>server hosts</i> of the XTACACS <i>server group</i> list. ▪ <i>tacacs+</i> – Adding this parameter will require the user to be authenticated using the TACACS+ protocol from the remote TACACS+ <i>server hosts</i> of the TACACS+ <i>server group</i> list. ▪ <i>radius</i> – Adding this parameter will require the user to be authenticated using the RADIUS protocol from the remote RADIUS <i>server hosts</i> of the RADIUS <i>server group</i> list. ▪ <i>server_group <string 15></i> - Adding this parameter will require the user to be authenticated using a user-defined server group previously configured on the Switch. ▪ <i>local</i> - Adding this parameter will require the user to be authenticated using the local <i>user account</i> database on the Switch. ▪ <i>none</i> – Adding this parameter will require no authentication to access the Switch. <i>method_list_name</i> – Enter a previously implemented method list name defined by the user. The user may add one, or a combination of up to four (4) of the following authentication methods to this method list: ▪ <i>tacacs</i> – Adding this parameter will require the user to be authenticated using the TACACS protocol from a remote TACACS server. ▪ <i>xtacacs</i> – Adding this parameter will require the user to be authenticated using the XTACACS protocol from a remote XTACACS server. ▪ <i>tacacs+</i> – Adding this parameter will require the user to be authenticated using the TACACS+ protocol from a remote TACACS+ server. ▪ <i>radius</i> – Adding this parameter will require the user to be authenticated using the RADIUS protocol from a remote RADIUS server.
Parameters	▪ <i>server_group <string 15></i> - Adding this parameter will require the user to be authenticated using a user-defined server group previously configured on the Switch. ▪ <i>local</i> - Adding this parameter will require the user to be authenticated using the local <i>user account</i> database on the Switch. ▪ <i>none</i> – Adding this parameter will require no authentication to access the Switch. NOTE: Entering <i>none</i> or <i>local</i> as an authentication protocol will override any other authentication that follows it on a method list or on the default method list.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the user defined method list “Trinity” with authentication methods tacacs, xtacacs and local, in that order.

```
DGS-3400:4#config_authen_login method_list_name Trinity method tacacs xtacacs local
Command: config_authen_login method_list_name Trinity method tacacs xtacacs local
Success.
DGS-3400:4#
```

Example usage:

To configure the default method list with authentication methods xtacacs, tacacs+ and local, in that order:

```
DGS-3400:4#config authen_login default method xtacacs tacacs+ local
Command: config authen_login default method xtacacs tacacs+ local

Success.

DGS-3400:4#
```

delete authen_login method_list_name

Purpose	Used to delete a previously configured user defined method list of authentication methods for users logging on to the Switch.
Syntax	delete authen_login method_list_name <string 15>
Description	This command is used to delete a list for authentication methods for user login.
Parameters	<i><string 15></i> - Enter an alphanumeric string of up to 15 characters to define the given <i>method list</i> to delete.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the method list name “Trinity”:

```
DGS-3400:4#delete authen_login method_list_name Trinity
Command: delete authen_login method_list_name Trinity

Success.

DGS-3400:4#
```

show authen_login

Purpose	Used to display a previously configured user defined method list of authentication methods for users logging on to the Switch.
Syntax	show authen_login [default method_list_name <string 15> all]
Description	This command is used to show a list of authentication methods for user login.
Parameters	<i>default</i> – Entering this parameter will display the default method list for users logging on to the Switch. <i>method_list_name <string 15></i> - Enter an alphanumeric string of up to 15 characters to define the given <i>method list</i> the user wishes to view. <i>all</i> – Entering this parameter will display all the authentication login methods currently configured on the Switch. The window will display the following parameters: - Method List Name – The name of a previously configured method list name. - Priority – Defines which order the method list protocols will be queried for authentication when a user attempts to log on to the Switch. Priority ranges from 1(highest) to 4 (lowest). - Method Name – Defines which security protocols are implemented, per method list name. - Comment – Defines the type of Method. <i>User-defined Group</i> refers to server group defined by the user. <i>Built-in Group</i> refers to the TACACS, XTACACS, TACACS+ and RADIUS security protocols which are permanently set in the Switch. <i>Keyword</i> refers to authentication using a technique INSTEAD of TACACS / XTACACS / TACACS+ / RADIUS which are local (authentication through the user account on the Switch) and none (no authentication necessary to access any function on the Switch).
Restrictions	None.

Example usage:

To view the authentication login method list named Trinity:

```
DGS-3400:4#show authen_login method_list_name Trinity
Command: show authen_login method_list_name Trinity

Method List Name  Priority  Method Name  Comment
-----
Trinity           1         tacacs+      Built-in Group
                  2         tacacs       Built-in Group
                  3         Darren      User-defined Group
                  4         local       Keyword

DGS-3400:4#
```

create authen_enable method_list_name

Purpose	Used to create a user-defined method list of authentication methods for promoting normal user level privileges to Administrator level privileges on the Switch.
Syntax	create authen_enable method_list_name <string 15>
Description	This command is used to promote users with normal level privileges to Administrator level privileges using authentication methods on the Switch. Once a user acquires normal user level privileges on the Switch, he or she must be authenticated by a method on the Switch to gain administrator privileges on the Switch, which is defined by the Administrator. A maximum of eight (8) enable method lists can be implemented on the Switch.
Parameters	<string 15> - Enter an alphanumeric string of up to 15 characters to define the given <i>enable method list</i> to create.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create a user-defined method list, named "Permit" for promoting user privileges to Administrator privileges:

```
DGS-3400:4#create authen_enable method_list_name Permit
Command: show authen_login method_list_name Permit

Success.

DGS-3400:4#
```

config authen_enable

Purpose	Used to configure a user-defined method list of authentication methods for promoting normal user level privileges to Administrator level privileges on the Switch.
Syntax	config authen_enable [default method_list_name <string 15>] method {tacacs xtacacs tacacs+ radius server_group <string 15> local_enable none}
Description	This command is used to promote users with normal level privileges to Administrator level privileges using authentication methods on the Switch. Once a user acquires normal user level privileges on the Switch, he or she must be authenticated by a method on the Switch to gain administrator privileges on the Switch, which is defined by the Administrator. A maximum of eight (8) enable method lists can be implemented simultaneously on the Switch. The sequence of methods implemented in this command will affect the authentication result. For example, if a user enters a sequence of methods like <i>tacacs – xtacacs – local_enable</i> , the Switch will send an authentication request to the first TACACS host in the server group.

config authn_enable

If no verification is found, the Switch will send an authentication request to the second TACACS host in the server group and so on, until the list is exhausted. At that point, the Switch will restart the same sequence with the following protocol listed, *xtacacs*. If no authentication takes place using the *xtacacs* list, the *local_enable* password set in the Switch is used to authenticate the user.

Successful authentication using any of these methods will give the user an “Admin” level privilege.

Parameters

default – The default method list for administration rights authentication, as defined by the user. The user may choose one or a combination of up to four (4) of the following authentication methods:

- *tacacs* – Adding this parameter will require the user to be authenticated using the TACACS protocol from the remote TACACS *server hosts* of the TACACS *server group* list.
- *xtacacs* – Adding this parameter will require the user to be authenticated using the XTACACS protocol from the remote XTACACS *server hosts* of the XTACACS *server group* list.
- *tacacs+* – Adding this parameter will require the user to be authenticated using the TACACS+ protocol from the remote TACACS+ *server hosts* of the TACACS+ *server group* list.
- *radius* – Adding this parameter will require the user to be authenticated using the RADIUS protocol from the remote RADIUS *server hosts* of the RADIUS *server group* list.
- *server_group* <string 15> - Adding this parameter will require the user to be authenticated using a user-defined server group previously configured on the Switch.
- *local_enable* - Adding this parameter will require the user to be authenticated using the local *user account* database on the Switch.
- *none* – Adding this parameter will require no authentication to access the Switch.

method_list_name – Enter a previously implemented method list name defined by the user (*create authn_enable*). The user may add one, or a combination of up to four (4) of the following authentication methods to this method list:

- *tacacs* – Adding this parameter will require the user to be authenticated using the TACACS protocol from a remote TACACS server.
- *xtacacs* – Adding this parameter will require the user to be authenticated using the XTACACS protocol from a remote XTACACS server.
- *tacacs+* – Adding this parameter will require the user to be authenticated using the TACACS+ protocol from a remote TACACS+ server.
- *radius* - Adding this parameter will require the user to be authenticated using the RADIUS protocol from a remote RADIUS server.

Parameters

- *server_group* <string 15> - Adding this parameter will require the user to be authenticated using a user-defined server group previously configured on the Switch.
- *local_enable* - Adding this parameter will require the user to be authenticated using the local *user account* database on the Switch. The local enable password of the device can be configured using the “**config admin local_password**” command.
- *none* – Adding this parameter will require no authentication to access the administration level privileges on the Switch.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To configure the user defined method list “Permit” with authentication methods TACACS, XTACACS and local, in that order.

```
DGS-3400:4#config authen_enable method_list_name Trinity method
tacacs xtacacs local
Command: config authen_enable method_list_name Trinity method
tacacs xtacacs local

Success.

DGS-3400:4#
```

Example usage:

To configure the default method list with authentication methods XTACACS, TACACS+ and local, in that order:

```
DGS-3400:4#config authen_enable default method xtacacs tacacs+ local
Command: config authen_enable default method xtacacs tacacs+ local

Success.

DGS-3400:4#
```

delete authen_enable method_list_name

Purpose	Used to delete a user-defined method list of authentication methods for promoting normal user level privileges to Administrator level privileges on the Switch.
Syntax	delete authen_enable method_list_name <string 15>
Description	This command is used to delete a user-defined method list of authentication methods for promoting user level privileges to Administrator level privileges.
Parameters	<i><string 15></i> - Enter an alphanumeric string of up to 15 characters to define the given <i>enable method list</i> to delete.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the user-defined method list "Permit"

```
DGS-3400:4#delete authen_enable method_list_name Permit
Command: delete authen_enable method_list_name Permit

Success.

DGS-3400:4#
```

show authen_enable

Purpose	Used to display the method list of authentication methods for promoting normal user level privileges to Administrator level privileges on the Switch.
Syntax	show authen_enable [default method_list_name <string 15> all]
Description	This command is used to delete a user-defined method list of authentication methods for promoting user level privileges to Administrator level privileges.
Parameters	<i>default</i> – Entering this parameter will display the default method list for users attempting to gain access to Administrator level privileges on the Switch. <i>method_list_name <string 15></i> - Enter an alphanumeric string of up to 15 characters to define the given <i>method list</i> to view.

show authen_enable

all – Entering this parameter will display all the authentication login methods currently configured on the Switch.

The window will display the following parameters:

- Method List Name – The name of a previously configured method list name.
- Priority – Defines which order the method list protocols will be queried for authentication when a user attempts to log on to the Switch. Priority ranges from 1(highest) to 4 (lowest).
- Method Name – Defines which security protocols are implemented, per method list name.
- Comment – Defines the type of Method. *User-defined Group* refers to *server groups* defined by the user. *Built-in Group* refers to the TACACS, XTACACS, TACACS+ and RADIUS security protocols which are permanently set in the Switch. *Keyword* refers to authentication using a technique INSTEAD of TACACS/XTACACS/TACACS+/RADIUS which are local (authentication through the *local_enable* password on the Switch) and none (no authentication necessary to access any function on the Switch).

Restrictions

None.

Example usage:

To display all method lists for promoting user level privileges to administrator level privileges.

DGS-3400:4#show authen_enable all			
Command: show authen_enable all			
Method List Name	Priority	Method Name	Comment
Permit	1	tacacs+	Built-in Group
	2	tacacs	Built-in Group
	3	Darren	User-defined Group
	4	local	Keyword
default	1	tacacs+	Built-in Group
	2	local	Keyword
Total Entries : 2			
DGS-3400:4#			

config authen application

Purpose	Used to configure various applications on the Switch for authentication using a previously configured method list.
Syntax	config authen application [console telnet ssh http all] [login enable] [default method_list_name <string 15>]
Description	This command is used to configure Switch configuration applications (console, Telnet, SSH, web) for login at the user level and at the administration level (<i>authen_enable</i>) utilizing a previously configured method list.
Parameters	<i>application</i> – Choose the application to configure. The user may choose one of the following five options to configure. ▪ <i>console</i> – Choose this parameter to configure the command line interface login method. ▪ <i>telnet</i> – Choose this parameter to configure the telnet login

config authen application

method.

- *ssh* – Choose this parameter to configure the Secure Shell login method.
- *http* – Choose this parameter to configure the web interface login method.
- *all* – Choose this parameter to configure all applications (console, Telnet, SSH, web) login method.

login – Use this parameter to configure an application for normal login on the user level, using a previously configured method list.

enable – Use this parameter to configure an application for upgrading a normal user level to administrator privileges, using a previously configured method list.

default – Use this parameter to configure an application for user authentication using the default method list.

method_list_name <string 15> - Use this parameter to configure an application for user authentication using a previously configured method list. Enter an alphanumeric string of up to 15 characters to define a previously configured method list.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure the default method list for the web interface:

DGS-3400:4#config authen application http login default

Command: config authen application http login default

Success.

DGS-3400:4#

show authen application

Purpose	Used to display authentication methods for the various applications on the Switch.
Syntax	show authen application
Description	This command will display all of the authentication method lists (login, enable administrator privileges) for Switch configuration applications (console, Telnet, SSH, web) currently configured on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To display the login and enable method list for all applications on the Switch:

DGS-3400:4#show authen application

Command: show authen application

Application	Login Method List	Enable Method List
Console	default	default
Telnet	Trinity	default
SSH	default	default
HTTP	default	default

DGS-3400:4#

create authen server_host

Purpose	Used to create an authentication server host.
Syntax	create authen server_host <ipaddr> protocol [tacacs xtacacs tacacs+ radius] {port <int 1-65535> key [<key_string 254> none] timeout <int 1-255> retransmit < 1-255>}
Description	This command will create an authentication server host for the TACACS/XTACACS/TACACS+/RADIUS security protocols on the Switch. When a user attempts to access the Switch with authentication protocol enabled, the Switch will send authentication packets to a remote TACACS/XTACACS/TACACS+/RADIUS server host on a remote host. The TACACS/XTACACS/TACACS+/RADIUS server host will then verify or deny the request and return the appropriate message to the Switch. More than one authentication protocol can be run on the same physical server host but, remember that TACACS/XTACACS/TACACS+/RADIUS are separate entities and are not compatible with each other. The maximum supported number of server hosts is 16.
Parameters	<i>server_host</i> <ipaddr> - The IP address of the remote server host to add. <i>protocol</i> – The protocol used by the server host. The user may choose one of the following: ▪ <i>tacacs</i> – Enter this parameter if the server host utilizes the TACACS protocol. ▪ <i>xtacacs</i> - Enter this parameter if the server host utilizes the XTACACS protocol. ▪ <i>tacacs+</i> - Enter this parameter if the server host utilizes the TACACS+ protocol. ▪ <i>radius</i> - Enter this parameter if the server host utilizes the RADIUS protocol. <i>port</i> <int 1-65535> - Enter a number between 1 and 65535 to define the virtual port number of the authentication protocol on a server host. The default port number is 49 for TACACS/XTACACS/TACACS+ servers and 1812 and 1813 for RADIUS servers but the user may set a unique port number for higher security. <i>key</i> <key_string 254> - Authentication key to be shared with a configured TACACS+ or RADIUS server only. Specify an alphanumeric string up to 254 characters. <i>timeout</i> <int 1-255> - Enter the time in seconds the Switch will wait for the server host to reply to an authentication request. The default value is 5 seconds. <i>retransmit</i> <int 1-255> - Enter the value in the retransmit field to change how many times the device will resend an authentication request when the server does not respond.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create a TACACS+ authentication server host, with port number 1234, a timeout value of 10 seconds and a retransmit count of 5.

```
DGS-3400:4#create authen server_host 10.1.1.121 protocol tacacs+ port 1234
timeout 10 retransmit 5
```

```
Command: create authen server_host 10.1.1.121 protocol tacacs+ port 1234
timeout 10 retransmit 5
```

Success.

```
DGS-3400:4#
```

config authen server_host

Purpose	Used to configure a user-defined authentication server host.
Syntax	create authen server_host <ipaddr> protocol [tacacs xtacacs tacacs+ radius] {port <int 1-65535> key [<key_string 254> none] timeout <int 1-255> retransmit < 1-255>}
Description	This command will configure a user-defined authentication server host for the TACACS/XTACACS/TACACS+/RADIUS security protocols on the Switch. When a user attempts to access the Switch with the authentication protocol enabled, the Switch will send authentication packets to a remote TACACS/XTACACS/TACACS+/RADIUS server host on a remote host. The TACACS/XTACACS/TACACS+/RADIUS server host will then verify or deny the request and return the appropriate message to the Switch. More than one authentication protocol can be run on the same physical server host but, remember that TACACS/XTACACS/TACACS+/RADIUS are separate entities and are not compatible with each other. The maximum supported number of server hosts is 16.
Parameters	<i>server_host</i> <ipaddr> - The IP address of the remote server host the user wishes to alter. <i>protocol</i> – The protocol used by the server host. The user may choose one of the following: ▪ <i>tacacs</i> – Enter this parameter if the server host utilizes the TACACS protocol. ▪ <i>xtacacs</i> - Enter this parameter if the server host utilizes the XTACACS protocol. ▪ <i>tacacs+</i> - Enter this parameter if the server host utilizes the TACACS+ protocol. ▪ <i>radius</i> - Enter this parameter if the server host utilizes the RADIUS protocol. <i>port</i> <int 1-65535> - Enter a number between 1 and 65535 to define the virtual port number of the authentication protocol on a server host. The default port number is 49 for TACACS/XTACACS/TACACS+ servers and 1812 and 1813 for RADIUS servers but the user may set a unique port number for higher security. <i>key</i> <key_string 254> - Authentication key to be shared with a configured TACACS+ or RADIUS server only. Specify an alphanumeric string up to 254 characters or choose none. <i>timeout</i> <int 1-255> - Enter the time in seconds the Switch will wait for the server host to reply to an authentication request. The default value is 5 seconds. <i>retransmit</i> <int 1-255> - Enter the value in the retransmit field to change how many times the device will resend an authentication request when the server does not respond. This field is inoperable for the TACACS+ protocol.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure a TACACS+ authentication server host, with port number 4321, a timeout value of 12 seconds and a retransmit count of 4.

```
DGS-3400:4#config authen server_host 10.1.1.121 protocol tacacs+
port 4321 timeout 12 retransmit 4
```

```
Command: config authen server_host 10.1.1.121 protocol tacacs+ port
4321 timeout 12 retransmit 4
```

```
Success.
```

```
DGS-3400:4#
```

delete authen server_host

Purpose	Used to delete a user-defined authentication server host.
Syntax	delete authen server_host <ipaddr> protocol [tacacs xtacacs tacacs+ radius]
Description	This command is used to delete a user-defined authentication server host previously created on the Switch.
Parameters	<i>server_host</i> <ipaddr> - The IP address of the remote server host to be deleted. <i>protocol</i> – The protocol used by the server host the user wishes to delete. The user may choose one of the following: ▪ <i>tacacs</i> – Enter this parameter if the server host utilizes the TACACS protocol. ▪ <i>xtacacs</i> - Enter this parameter if the server host utilizes the XTACACS protocol. ▪ <i>tacacs+</i> - Enter this parameter if the server host utilizes the TACACS+ protocol. ▪ <i>radius</i> - Enter this parameter if the server host utilizes the RADIUS protocol.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete a user-defined TACACS+ authentication server host:

```
DGS-3400:4#delete authen server_host 10.1.1.121 protocol tacacs+
Command: delete authen server_host 10.1.1.121 protocol tacacs+

Success.

DGS-3400:4#
```

show authen server_host

Purpose	Used to view a user-defined authentication server host.
Syntax	show authen server_host
Description	This command is used to view user-defined authentication server hosts previously created on the Switch. The following parameters are displayed: IP Address – The IP address of the authentication server host. Protocol – The protocol used by the server host. Possible results will include TACACS, XTACACS, TACACS+ or RADIUS. Port – The virtual port number on the server host. The default value is 49. Timeout - The time in seconds the Switch will wait for the server host to reply to an authentication request. Retransmit - The value in the retransmit field denotes how many times the device will resend an authentication request when the TACACS server does not respond. This field is inoperable for the tacacs+ protocol. Key - Authentication key to be shared with a configured TACACS+ server only.
Parameters	None.
Restrictions	None.

Example usage:

To view authentication server hosts currently set on the Switch:

```
DGS-3400:4#show authen server_host
Command: show authen server_host

IP Address  Protocol  Port  Timeout  Retransmit  Key
-----
10.53.13.94  TACACS   49    5         2           -----

Total Entries : 1

DGS-3400:4#
```

create authen server_group

Purpose	Used to create a user-defined authentication server group.
Syntax	create authen server_group <string 15>
Description	This command will create an authentication server group. A server group is a technique used to group TACACS/XTACACS/TACACS+/RADIUS server hosts into user defined categories for authentication using method lists. The user may add up to eight (8) authentication server hosts to this group using the config authen server_group command.
Parameters	<i><string 15></i> - Enter an alphanumeric string of up to 15 characters to define the newly created server group.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To create the server group “group_1”:

```
DGS-3400:4#create authen server_group group_1
Command: create authen server_group group_1

Success.

DGS-3400:4#
```

config authen server_group

Purpose	Used to configure a user-defined authentication server group.
Syntax	config authen server_group [tacacs xtacacs tacacs+ radius <string 15>] [add delete] server_host <ipaddr> protocol [tacacs xtacacs tacacs+ radius]
Description	This command will configure an authentication server group. A server group is a technique used to group TACACS/XTACACS/TACACS+/RADIUS server hosts into user defined categories for authentication using method lists. The user may define the type of server group by protocol or by previously defined server group. Up to eight (8) authentication server hosts may be added to any particular group
Parameters	<i>server_group</i> - The user may define the group by protocol groups built into the Switch (TACACS/XTACACS/TACACS+/RADIUS), or by a user-defined group previously created using the <i>create authen server_group</i> command. <i>tacacs</i> – Use this parameter to utilize the built-in TACACS server protocol on the Switch. Only server hosts utilizing the TACACS

config authn server_group

protocol may be added to this group.

- *xtacacs* – Use this parameter to utilize the built-in XTACACS server protocol on the Switch. Only server hosts utilizing the XTACACS protocol may be added to this group.
- *tacacs+* – Use this parameter to utilize the built-in TACACS+ server protocol on the Switch. Only server hosts utilizing the TACACS+ protocol may be added to this group.
- *radius* – Use this parameter to utilize the built-in RADIUS server protocol on the Switch. Only server hosts utilizing the RADIUS protocol may be added to this group.
- *<string 15>* – Enter an alphanumeric string of up to 15 characters to define the previously created server group. This group may add any combination of server hosts to it, regardless of protocol.

add/delete – Enter the correct parameter to add or delete a server host from a server group.

server_host <ipaddr> - Enter the IP address of the previously configured server host to add or delete.

protocol – Enter the protocol utilized by the server host. There are three options:

- *tacacs* – Use this parameter to define the protocol if the server host is using the TACACS authentication protocol.
- *xtacacs* – Use this parameter to define the protocol if the server host is using the XTACACS authentication protocol.
- *tacacs+* – Use this parameter to define the protocol if the server host is using the TACACS+ authentication protocol.
- *radius* – Use this parameter to define the protocol if the server host is using the RADIUS authentication protocol.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To add an authentication host to server group “group_1”:

```
DGS-3400:4# config authn server_group group_1 add server_host
10.1.1.121 protocol tacacs+
Command: config authn server_group group_1 add server_host
10.1.1.121 protocol tacacs+

Success.

DGS-3400:4#
```

delete authn server_group

Purpose	Used to delete a user-defined authentication server group.
Syntax	delete authn server_group <string 15>
Description	This command will delete an authentication server group.
Parameters	<i><string 15></i> - Enter an alphanumeric string of up to 15 characters to define the previously created server group to be deleted.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To delete the server group “group_1”:

DGS-3400:4#delete server_group group_1

Command: delete server_group group_1

Success.

DGS-3400:4#

show authen server_group

Purpose	Used to view authentication server groups on the Switch.
Syntax	show authen server_group <string 15>
Description	This command will display authentication server groups currently configured on the Switch. This command will display the following fields: Group Name: The name of the server group currently configured on the Switch, including built in groups and user defined groups. IP Address: The IP address of the server host. Protocol: The authentication protocol used by the server host.
Parameters	<string 15> - Enter an alphanumeric string of up to 15 characters to define the previously created server group to be viewed. Entering this command without the <string> parameter will display all authentication server groups on the Switch.
Restrictions	None.

Example usage:

To view authentication server groups currently set on the Switch.

DGS-3400:4#show authen server_group

Command: show authen server_group

Group Name	IP Address	Protocol
-----	-----	-----
Darren	10.53.13.2	TACACS
tacacs	10.53.13.94	TACACS
tacacs+	(This group has no entry)	
-----	(This group has no entry)	

Total Entries : 4

DGS-3400:4#

config authen parameter response_timeout

Purpose	Used to configure the amount of time the Switch will wait for a user to enter authentication before timing out.
Syntax	config authen parameter response_timeout <int 0-255>
Description	This command will set the time the Switch will wait for a response of authentication from the user.
Parameters	response_timeout <int 0-255> - Set the time, in seconds, the Switch will wait for a response of authentication from the user attempting to log in from the command line interface or telnet interface. "0" (integer zero) means there won't be a time-out. The default value is 30 seconds.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the response timeout for 60 seconds:

```
DGS-3400:4# config authen parameter response_timeout 60
Command: config authen parameter response_timeout 60

Success.

DGS-3400:4#
```

config authen parameter attempt

Purpose	Used to configure the maximum number of times the Switch will accept authentication attempts.
Syntax	config authen parameter attempt <int 1-255>
Description	This command will configure the maximum number of times the Switch will accept authentication attempts. Users failing to be authenticated after the set amount of attempts will be denied access to the Switch and will be locked out of further authentication attempts. Command line interface users will have to wait 60 seconds before another authentication attempt. Telnet users will be disconnected from the Switch.
Parameters	<i>parameter attempt <int 1-255></i> - Set the maximum number of attempts the user may try to become authenticated by the Switch, before being locked out.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To set the maximum number of authentication attempts at 5:

```
DGS-3400:4# config authen parameter attempt 5
Command: config authen parameter attempt 5

Success.

DGS-3400:4#
```

show authen parameter

Purpose	Used to display the authentication parameters currently configured on the Switch.
Syntax	show authen parameter
Description	This command will display the authentication parameters currently configured on the Switch, including the response timeout and user authentication attempts. This command will display the following fields: Response timeout – The configured time allotted for the Switch to wait for a response of authentication from the user attempting to log in from the command line interface or telnet interface. User attempts - The maximum number of attempts the user may try to become authenticated by the Switch, before being locked out.
Parameters	None.
Restrictions	None.

Example usage:

To view the authentication parameters currently set on the Switch:

DGS-3400:4#show authen parameter

Command: show authen parameter

Response timeout : 60 seconds

User attempts : 5

DGS-3400:4#

enable admin

Purpose	Used to promote user level privileges to administrator level privileges
Syntax	enable admin
Description	This command is for users who have logged on to the Switch on the normal user level, to become promoted to the administrator level. After logging on to the Switch users will have only user level privileges. To gain access to administrator level privileges, the user will enter this command and will have to enter an authentication password. Possible authentication methods for this function include TACACS, XTACACS, TACACS+, RADIUS, user defined server groups, local enable (local account on the Switch), or no authentication (<i>none</i>). Because XTACACS and TACACS do not support the enable function, the user must create a special account on the server host which has the username "enable", and a password configured by the administrator that will support the "enable" function. This function becomes inoperable when the authentication policy is disabled.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable administrator privileges on the Switch:

DGS-3400:4#enable admin

Password: *****

DGS-3400:4#

config admin local_enable

Purpose	Used to configure the local enable password for administrator level privileges.
Syntax	config admin local_enable
Description	This command will configure the locally enabled password for the enable admin command. When a user chooses the " <i>local_enable</i> " method to promote user level privileges to administrator privileges, he or she will be prompted to enter the password configured here, that is set locally on the Switch.
Parameters	<i><password 15></i> - After entering this command, the user will be prompted to enter the old password, then a new password in an alphanumeric string of no more than 15 characters, and finally prompted to enter the new password again for confirmation. See the example below.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To configure the password for the “local_enable” authentication method.

```
DGS-3400:4#config admin local_enable
Command: config admin local_enable

Enter the old password:
Enter the case-sensitive new password:*****
Enter the new password again for confirmation:*****
Success.

DGS-3400:4#
```

SSH COMMANDS

The steps required to use the Secure Shell (SSH) protocol for secure communication between a remote PC (the SSH Client) and the Switch (the SSH Server), are as follows:

- Create a user account with admin-level access using the **create account admin <username> <password>** command. This is identical to creating any other admin-level user account on the Switch, including specifying a password. This password is used to login to the Switch, once secure communication has been established using the SSH protocol.
- Configure the user account to use a specified authorization method to identify users that are allowed to establish SSH connections with the Switch using the **config ssh user authmode** command. There are three choices as to the method SSH will use to authorize the user, and they are *password*, *publickey* and *hostbased*.
- Configure the encryption algorithm that SSH will use to encrypt and decrypt messages sent between the SSH Client and the SSH Server.
- Finally, enable SSH on the Switch using the **enable ssh** command.

After following the above steps, users can configure an SSH Client on the remote PC and manage the Switch using secure, in-band communication.

The Secure Shell (SSH) commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable ssh	
disable ssh	
config ssh authmode	[password publickey hostbased] [enable disable]
show ssh authmode	
config ssh server	{maxsession <int 1-8> contimeout <sec 120-600> authfail <int 2-20> rekey [10min 30min 60min never]}
show ssh server	
config ssh user	<username> authmode [hostbased [hostname <domain_name> hostname_IP <domain_name> <ipaddr>] password publickey]
show ssh user authmode	
config ssh algorithm	[3DES AES128 AES192 AES256 arcfour blowfish cast128 twofish128 twofish192 twofish256 MD5 SHA1 RSA DSA] [enable disable]
show ssh algorithm	

Each command is listed, in detail, in the following sections.

enable ssh

Purpose	Used to enable SSH.
Syntax	enable ssh
Description	This command allows users to enable SSH on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Usage example:

To enable SSH:

DGS-3400:4#enable ssh

Command: enable ssh

TELNET will be disabled when enable SSH.

Success.

DGS-3400:4#

disable ssh

Purpose	Used to disable SSH.
Syntax	disable ssh
Description	This command allows users to disable SSH on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Usage example:

To disable SSH:

DGS-3400:4# disable ssh

Command: disable ssh

Success.

DGS-3400:4#

config ssh authmode

Purpose	Used to configure the SSH authentication mode setting.
Syntax	config ssh authmode [password publickey hostbased] [enable disable]
Description	This command will allow users to configure the SSH authentication mode for users attempting to access the Switch.
Parameters	<i>password</i> – This parameter may be chosen if the administrator wishes to use a locally configured password for authentication on the Switch. <i>publickey</i> - This parameter may be chosen to use a publickey configuration set on a SSH server, for authentication. <i>hostbased</i> - This parameter may be chosen to use a host computer for authentication. This parameter is intended for Linux users requiring SSH authentication techniques and the host computer is running the Linux operating system with a SSH program previously installed. <i>[enable disable]</i> - This allows users to enable or disable SSH authentication on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable the SSH authentication mode by password:

DGS-3400:4#config ssh authmode password enable

Command: config ssh authmode password enable

Success.

DGS-3400:4#

show ssh authmode

Purpose	Used to display the SSH authentication mode setting.
Syntax	show ssh authmode
Description	This command will allow users to display the current SSH authentication set on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To view the current authentication mode set on the Switch:

DGS-3400:4#show ssh authmode

Command: show ssh authmode

The SSH authmode:

Password : Enabled

Publickey : Enabled

Hostbased : Enabled

DGS-3400:4#

config ssh server

Purpose	Used to configure the SSH server.
Syntax	config ssh server {maxsession <int 1-8> timeout <sec 120-600> authfail <int 2-20> rekey [10min 30min 60min never]}
Description	This command allows users to configure parameters for the SSH server setting on the Switch.
Parameters	<i>maxsession <int 1-8></i> - Allows the user to set the number of users that may simultaneously access the Switch. The default setting is 8. <i>timeout <sec 120-600></i> - Allows the user to set the connection timeout. The user may set a time between 120 and 600 seconds. The default is 300 seconds. <i>authfail <int 2-20></i> - Allows the administrator to set the maximum number of attempts that a user may try to logon utilizing SSH authentication. After the maximum number of attempts is exceeded, the Switch will be disconnected and the user must reconnect to the Switch to attempt another login. <i>rekey [10min 30min 60min never]</i> - Sets the time period that the Switch will change the security shell encryptions.
Restrictions	Only administrator-level users can issue this command.

Usage example:

To configure the SSH server:

```
DGS-3400:4# config ssh server maxsession 2 contimeout 300 authfail 2
Command: config ssh server maxsession 2 contimeout 300 authfail 2

Success.

DGS-3400:4#
```

show ssh server

Purpose	Used to display the SSH server setting.
Syntax	show ssh server
Description	This command allows users to display the current SSH server setting.
Parameters	None.
Restrictions	None.

Usage example:

To display the SSH server:

```
DGS-3400:4# show ssh server
Command: show ssh server

SSH Server Status      : Disabled
SSH Max Session        : 8
Connection timeout     : 120
Authenticate failed attempts : 2
Rekey timeout          : never
Listened Port Number   : 22

DGS-3400:4#
```

config ssh user

Purpose	Used to configure the SSH user.
Syntax	config ssh user <username> authmode [hostbased [hostname <domain_name> hostname_IP <domain_name> <ipaddr>] password publickey]
Description	This command allows users to configure the SSH user authentication method.
Parameters	<username> - Enter a username of no more than 15 characters to identify the SSH user. authmode – Specifies the authentication mode of the SSH user wishing to log on to the Switch. The administrator may choose between: hostbased – This parameter should be chosen to use a remote SSH server for authentication purposes. Choosing this parameter requires the user to input the following information to identify the SSH user. hostname <domain_name> - Enter an alphanumeric string of up to 32 characters identifying the remote SSH user. hostname_IP <domain_name> <ipaddr> - Enter the hostname and the corresponding IP address of the SSH user. password – This parameter should be to use an administrator defined password for authentication. Upon entry of this command, the Switch will prompt the user for a password, and then to retype the password for confirmation.

config ssh user

publickey – This parameter should be chosen to use the publickey on a SSH server for authentication.

Restrictions Only administrator-level users can issue this command.

Example usage:

To configure the SSH user:

DGS-3400:4# config ssh user Trinity authmode Password
Command: config ssh user Trinity authmode Password

Enter a case sensitive new password: *****

Enter the new password again for conformation:*****

Success.

DGS-3400:4#

show ssh user authmode

Purpose	Used to display the SSH user setting.
Syntax	show ssh user authmode
Description	This command allows users to display the current SSH user setting.
Parameters	None.
Restrictions	None.

Example usage:

To display the SSH user:

DGS-3400:4#show ssh user authmode

Command: show ssh user authmode

Current Accounts:

UserName	Authentication	Host Name	Host IP
Trinity	Hostbased	12334	10.45.25.8

DGS-3400:4#

Note: To configure the SSH user, the administrator must create a user account on the Switch. For information concerning configuring a user account, please see the section of this manual entitled **Basic Switch Commands** and then the command, **create account user**.

config ssh algorithm

Purpose	Used to configure the SSH algorithm.
Syntax	config ssh algorithm [3DES AES128 AES192 AES256 arcfour blowfish cast128 twofish128 twofish192 twofish256 MD5 SHA1 RSA DSA] [enable disable]
Description	This command allows users to configure the desired type of SSH algorithm used for authentication encryption.
Parameters	<i>3DES</i> – This parameter will enable or disable the Triple_Data

config ssh algorithm

Encryption Standard encryption algorithm.

AES128 - This parameter will enable or disable the Advanced Encryption Standard AES128 encryption algorithm.

AES192 - This parameter will enable or disable the Advanced Encryption Standard AES192 encryption algorithm.

AES256 - This parameter will enable or disable the Advanced Encryption Standard AES256 encryption algorithm.

arcfour - This parameter will enable or disable the Arcfour encryption algorithm.

blowfish - This parameter will enable or disable the Blowfish encryption algorithm.

cast128 - This parameter will enable or disable the Cast128 encryption algorithm.

twofish128 - This parameter will enable or disable the twofish128 encryption algorithm.

twofish192 - This parameter will enable or disable the twofish192 encryption algorithm.

MD5 - This parameter will enable or disable the MD5 Message Digest encryption algorithm.

SHA1 - This parameter will enable or disable the Secure Hash Algorithm encryption.

RSA - This parameter will enable or disable the RSA encryption algorithm.

DSA - This parameter will enable or disable the Digital Signature Algorithm encryption.

[enable | disable] – This allows users to enable or disable algorithms entered in this command, on the Switch.

Restrictions Only administrator-level users can issue this command.

Usage example:

To configure SSH algorithm:

DGS-3400:4# config ssh algorithm Blowfish enable

Command: config ssh algorithm Blowfish enable

Success.

DGS-3400:4#

show ssh algorithm

Purpose	Used to display the SSH algorithm setting.
Syntax	show ssh algorithm
Description	This command will display the current SSH algorithm setting status.
Parameters	None.
Restrictions	None.

Usage Example:

To display SSH algorithms currently set on the Switch:

DGS-3400:4#show ssh algorithm

Command: show ssh algorithm

Encryption Algorithm

3DES :Enabled
AES128 :Enabled
AES192 :Enabled
AES256 :Enabled
arcfour :Enabled
blowfish :Enabled
cast128 :Enabled
twofish128 :Enabled
twofish192 :Enabled
twofish256 :Enabled

Data Integrity Algorithm

MD5 :Enabled
SHA1 :Enabled

Public Key Algorithm

RSA :Enabled
DSA :Enabled

DGS-3400:4#

SSL COMMANDS

Secure Sockets Layer or **SSL** is a security feature that will provide a secure communication path between a host and client through the use of authentication, digital signatures and encryption. These security functions are implemented through the use of a *ciphersuite*, which is a security string that determines the exact cryptographic parameters, specific encryption algorithms and key sizes to be used for an authentication session and consists of three levels:

2. **Key Exchange:** The first part of the ciphersuite string specifies the public key algorithm to be used. This Switch utilizes the Rivest Shamir Adleman (RSA) public key algorithm and the Digital Signature Algorithm (DSA), specified here as the *DHE_DSS* Diffie-Hellman (DHE) public key algorithm. This is the first authentication process between client and host as they “exchange keys” in looking for a match and therefore authentication to be accepted to negotiate encryptions on the following level.
3. **Encryption:** The second part of the ciphersuite that includes the encryption used for encrypting the messages sent between client and host. The Switch supports two types of cryptology algorithms:

Stream Ciphers – There are two types of stream ciphers on the Switch, *RC4 with 40-bit keys* and *RC4 with 128-bit keys*. These keys are used to encrypt messages and need to be consistent between client and host for optimal use.

CBC Block Ciphers – CBC refers to Cipher Block Chaining, which means that a portion of the previously encrypted block of encrypted text is used in the encryption of the current block. The Switch supports the *3DES_EDE* encryption code defined by the Data Encryption Standard (DES) to create the encrypted text.

4. **Hash Algorithm:** This part of the ciphersuite allows the user to choose a message digest function which will determine a Message Authentication Code. This Message Authentication Code will be encrypted with a sent message to provide integrity and prevent against replay attacks. The Switch supports two hash algorithms, *MD5* (Message Digest 5) and *SHA* (Secure Hash Algorithm).

These three parameters are uniquely assembled in four choices on the Switch to create a three layered encryption code for secure communication between the server and the host. The user may implement any one or combination of the ciphersuites available, yet different ciphersuites will affect the security level and the performance of the secured connection. The information included in the ciphersuites is not included with the Switch and requires downloading from a third source in a file form called a *certificate*. This function of the Switch cannot be executed without the presence and implementation of the certificate file and can be downloaded to the Switch by utilizing a TFTP server. The Switch supports SSLv3 and TLSv1. Other versions of SSL may not be compatible with this Switch and may cause problems upon authentication and transfer of messages from client to host.

The Secure Sockets Layer (SSL) commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable ssl	{ciphersuite {RSA_with_RC4_128_MD5 RSA_with_3DES_EDE_CBC_SHA DHE_DSS_with_3DES_EDE_CBC_SHA RSA_EXPORT_with_RC4_40_MD5}}
disable ssl	{ciphersuite {RSA_with_RC4_128_MD5 RSA_with_3DES_EDE_CBC_SHA DHE_DSS_with_3DES_EDE_CBC_SHA RSA_EXPORT_with_RC4_40_MD5}}
config ssl cachetimeout timeout	<value 60-86400>
show ssl	{certificate}
show ssl cachetimeout	
download ssl certificate	<ipaddr> certfilename <path_filename 64> keyfilename <path_filename 64>

Each command is listed, in detail, in the following sections.

enable ssl

Purpose	To enable the SSL function on the Switch.
Syntax	enable ssl {ciphersuite {RSA_with_RC4_128_MD5 RSA_with_3DES_EDE_CBC_SHA DHE_DSS_with_3DES_EDE_CBC_SHA RSA_EXPORT_with_RC4_40_MD5}}
Description	This command will enable SSL on the Switch by implementing any one or combination of listed ciphersuites on the Switch. Entering this command without a parameter will enable the SSL status on the Switch. Enabling SSL will disable the web-manager on the Switch.
Parameters	<i>ciphersuite</i> - A security string that determines the exact cryptographic parameters, specific encryption algorithms and key sizes to be used for an authentication session. The user may choose any combination of the following: • <i>RSA_with_RC4_128_MD5</i> – This ciphersuite combines the RSA key exchange, stream cipher RC4 encryption with 128-bit keys and the MD5 Hash Algorithm. • <i>RSA_with_3DES_EDE_CBC_SHA</i> - This ciphersuite combines the RSA key exchange, CBC Block Cipher 3DES_EDE encryption and the SHA Hash Algorithm. • <i>DHE_DSS_with_3DES_EDE_CBC_SHA</i> - This ciphersuite combines the DSA Diffie Hellman key exchange, CBC Block Cipher 3DES_EDE encryption and SHA Hash Algorithm. • <i>RSA_EXPORT_with_RC4_40_MD5</i> - This ciphersuite combines the RSA Export key exchange, stream cipher RC4 encryption with 40-bit keys. The ciphersuites are enabled by default on the Switch, yet the SSL status is disabled by default. Enabling SSL with a ciphersuite will not enable the SSL status on the Switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable SSL on the Switch for all ciphersuites:

DGS-3400:4#enable ssl

Command:enable ssl

Note: Web will be disabled if SSL is enabled.

Success.

DGS-3400:4#

NOTE: Enabling SSL on the Switch will enable all ciphersuites. To utilize a particular ciphersuite, the user must eliminate other ciphersuites by using the **disable ssl** command along with the appropriate ciphersuites.

NOTE: Enabling the SSL function on the Switch will disable the port for the web manager (port 80). To log on to the web based manager, the entry of your URL must begin with *https://*. (ex. *https://10.90.90.90*)

disable ssl

Purpose	To disable the SSL function on the Switch.
Syntax	disable ssl {ciphersuite {RSA_with_RC4_128_MD5 RSA_with_3DES_EDE_CBC_SHA DHE_DSS_with_3DES_EDE_CBC_SHA RSA_EXPORT_with_RC4_40_MD5}}
Description	This command will disable SSL on the Switch and can be used to disable any one or combination of listed ciphersuites on the Switch.
Parameters	<i>ciphersuite</i> - A security string that determines the exact cryptographic parameters, specific encryption algorithms and key sizes to be used for an authentication session. The user may choose any combination of the following: • <i>RSA_with_RC4_128_MD5</i> – This ciphersuite combines the RSA key exchange, stream cipher RC4 encryption with 128-bit keys and the MD5 Hash Algorithm. • <i>RSA_with_3DES_EDE_CBC_SHA</i> - This ciphersuite combines the RSA key exchange, CBC Block Cipher 3DES_EDE encryption and the SHA Hash Algorithm. • <i>DHE_DSS_with_3DES_EDE_CBC_SHA</i> - This ciphersuite combines the DSA Diffie Hellman key exchange, CBC Block Cipher 3DES_EDE encryption and SHA Hash Algorithm. • <i>RSA_EXPORT_with_RC4_40_MD5</i> - This ciphersuite combines the RSA Export key exchange, stream cipher RC4 encryption with 40-bit keys.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the SSL status on the Switch:

```
DGS-3400:4#disable ssl
Command: disable ssl

Success.

DGS-3400:4#
```

To disable ciphersuite *RSA_EXPORT_with_RC4_40_MD5* only:

```
DGS-3400:4#disable ssl ciphersuite RSA_EXPORT_with_RC4_40_MD5
Command: disable ssl ciphersuite RSA_EXPORT_with_RC4_40_MD5

Success.

DGS-3400:4#
```

config ssl cachetimeout timeout

Purpose	Used to configure the SSL cache timeout.
Syntax	config ssl cachetimeout timeout <value 60-86400>
Description	This command will set the time between a new key exchange between a client and a host using the SSL function. A new SSL session is established every time the client and host go through a key exchange. Specifying a longer timeout will allow the SSL session to reuse the master key on future connections with that particular host, therefore speeding up the negotiation process.
Parameters	<i>timeout</i> <value 60-86400> - Enter a timeout value between 60 and 86400

config ssl cachetimeout timeout

seconds to specify the total time an SSL key exchange ID stays valid before the SSL module will require a new, full SSL negotiation for connection. The default cache timeout is 600 seconds

Restrictions Only administrator-level users can issue this command.

Example usage:

To set the SSL cachetimeout for 7200 seconds:

DGS-3400:4#config ssl cachetimeout timeout 7200

Command: config ssl cachetimeout timeout 7200

Success.

DGS-3400:4#

show ssl cachetimeout

Purpose Used to show the SSL cache timeout.

Syntax **show ssl cachetimeout**

Description Entering this command will allow the user to view the SSL cache timeout currently implemented on the Switch.

Parameters None.

Restrictions None.

Example usage:

To view the SSL cache timeout on the Switch:

DGS-3400:4#show ssl cachetimeout

Command: show ssl cachetimeout

Cache timeout is 600 second(s).

DGS-3400:4#

show ssl

Purpose Used to view the SSL status and the certificate file status on the Switch.

Syntax **show ssl {certificate}**

Description This command is used to view the SSL status on the Switch.

Parameters certificate – Adding this parameter will allow the user to view the SSL certificate file information currently implemented on the Switch.

Restrictions None.

Example usage:

To view the SSL status on the Switch:

```

DGS-3400:4#show ssl
Command: show ssl

SSL status                               Disabled
RSA_WITH_RC4_128_MD5                     0x0004 Enabled
RSA_WITH_3DES_EDE_CBC_SHA                 0x000A Enabled
DHE_DSS_WITH_3DES_EDE_CBC_SHA             0x0013 Enabled
RSA_EXPORT_WITH_RC4_40_MD5                0x0003 Enabled

DGS-3400:4#

```

Example usage:

To view certificate file information on the Switch:

```

DGS-3400:4# show ssl certificate
Command: show ssl certificate

Loaded with RSA Certificate!

DGS-3400:4#

```

download SSL certificate

Purpose	Used to download a certificate file for the SSL function on the Switch.
Syntax	download SSL certificate <ipaddr> certfilename <path_filename 64> keyfilename <path_filename 64>
Description	This command is used to download a certificate file for the SSL function on the Switch from a TFTP server. The certificate file is a data record used for authenticating devices on the network. It contains information on the owner, keys for authentication and digital signatures. Both the server and the client must have consistent certificate files for optimal use of the SSL function. The Switch only supports certificate files with .der file extensions.
Parameters	<i><ipaddr></i> - Enter the IP address of the TFTP server. <i>certfilename <path_filename 64></i> - Enter the path and the filename of the certificate file to download. <i>keyfilename <path_filename 64></i> - Enter the path and the filename of the key exchange file to download.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To download a certificate file and key file to the Switch:

```

DGS-3400:4#download ssl certificate 10.53.13.94 certfilename c:/cert.der keyfilename c:/pkey.der
Command: download ssl certificate 10.53.13.94 certfilename c:/cert.der keyfilename c:/pkey.der

Certificate Loaded Successfully!

DGS-3400:4#

```

JUMBO FRAME COMMANDS

Certain switches can support jumbo frames (frames larger than the standard Ethernet frame size of 1536 bytes). To transmit frames of up to 9K (and 9220 Bytes tagged), the user can increase the maximum transmission unit (MTU) size from the default of 1536 by enabling the Jumbo Frame command.

The jumbo frame commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable jumbo_frame	
disable jumbo_frame	
show jumbo_frame	

Each command is listed, in detail, in the following sections.

enable jumbo_frame

Purpose	Used to enable the jumbo frame function on the Switch.
Syntax	enable jumbo_frame
Description	This command will allow ethernet frames larger than 1536 bytes to be processed by the Switch. The maximum size of the jumbo frame may not exceed 9220 Bytes tagged.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable the jumbo frame function on the Switch:

```
DGS-3400:4#enable jumbo_frame
Command: enable jumbo_frame

Success.

DGS-3400:4#
```

disable jumbo_frame

Purpose	Used to disable the jumbo frame function on the Switch.
Syntax	disable jumbo_frame
Description	This command will disable the jumbo frame function on the Switch.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To disable the jumbo frame function on the Switch:

```
DGS-3400:4#disable jumbo_frame
```

```
Command: disable jumbo_frame
```

```
Success.
```

```
DGS-3400:4#
```

show jumbo_frame

Purpose	Used to show the status of the jumbo frame function on the Switch.
Syntax	show jumbo_frame
Description	This command will show the status of the jumbo frame function on the Switch.
Parameters	None.
Restrictions	None.

Usage Example:

To show the jumbo frame status currently configured on the Switch:

```
DGS-3400:4#show jumbo_frame
```

```
Command: show jumbo_frame
```

```
Jumbo frame state : disabled
```

```
Maximum Jumbo frame size : 1536 bytes.
```

```
DGS-3400:4#
```

D-LINK SINGLE IP MANAGEMENT COMMANDS

Simply put, D-Link Single IP Management is a concept that will stack switches together over Ethernet instead of using stacking ports or modules. Switches using D-Link Single IP Management (labeled here as SIM) must conform to the following rules:

- SIM is an optional feature on the Switch and can easily be enabled or disabled. SIM grouping has no effect on the normal operation of the Switch in the user's network.
- There are three classifications for switches using SIM. The Commander Switch(CS), which is the master switch of the group, Member Switch(MS), which is a switch that is recognized by the CS as a member of a SIM group, and a Candidate Switch(CaS), which is a switch that has a physical link to the SIM group but has not been recognized by the CS as a member of the SIM group.
- A SIM group can only have one Commander Switch(CS).
- All switches in a particular SIM group must be in the same broadcast domain.
- A SIM group accepts up to 32 switches (numbered 0-32), including the Commander Switch (numbered 0).
- There is no limit to the number of SIM groups in the same broadcast domain, however a single switch can only belong to one group.
- If multiple VLANs are configured, the SIM group will only utilize the default VLAN on any switch.
- SIM allows intermediate devices that do not support SIM. This enables the user to manage a switch that are more than one hop away from the CS.

The SIM group is a group of switches that are managed as a single entity. The xStack DGS-3400 Series may take on three different roles:

Commander Switch(CS) – This is a switch that has been manually configured as the controlling device for a group, and takes on the following characteristics:

- It has an IP Address.
- It is not a Commander Switch or Member Switch of another Single IP group.
- It is connected to the Member Switches through its management VLAN.

Member Switch(MS) – This is a switch that has joined a single IP group and is accessible from the CS, and it takes on the following characteristics:

- It is not a CS or MS of another IP group.
- It is connected to the CS through the CS management VLAN.

Candidate Switch(CaS) – This is a switch that is ready to join a SIM group but is not yet a member of the SIM group. The Candidate Switch may join the SIM group through an automatic function of the xStack DGS-3400, or by manually configuring it to be a MS of a SIM group. A switch configured as a CaS is not a member of a SIM group and will take on the following characteristics:

- It is not a CS or MS of another Single IP group.
- It is connected to the CS through the CS management VLAN.

The following rules also apply to the above roles:

1. Each device begins in the Candidate state.
2. CS's must change their role to CaS and then to MS, to become a MS of a SIM group. Thus the CS cannot directly be converted to a MS.
3. The user can manually configure a CS to become a CaS.
4. A MS can become a CaS by:
 - a. Being configured as a CaS through the CS.
 - b. If report packets from the CS to the MS time out.
5. The user can manually configure a CaS to become a CS
6. The CaS can be configured through the CS to become a MS.

After configuring one switch to operate as the CS of a SIM group, additional xStack DGS-3400 switches may join the group by either an automatic method or by manually configuring the Switch to be a MS. The CS will then serve as the in band entry point for access to the MS. The CS's IP address will become the path to all MS's of the group and the CS's Administrator's password, and/or authentication will control access to all MS's of the SIM group.

With SIM enabled, the applications in the CS will redirect the packet instead of executing the packets. The applications will decode the packet from the administrator, modify some data, then send it to the MS. After execution, the CS may receive a response packet from the MS, which it will encode and send back to the administrator.

When a CaS becomes a MS, it automatically becomes a member of the first SNMP community (include read/write and read only) to which the CS belongs. However if a MS has its own IP address, it can belong to SNMP communities to which other switches in the group, including the CS, do not belong.

The Upgrade to v1.61

To better improve SIM management, the xStack DGS-3400 series switches have been upgraded to version 1.61 in this release. Many improvements have been made, including:

The Commander Switch (CS) now has the capability to automatically rediscover member switches that have left the SIM group, either through a reboot or web malfunction. This feature is accomplished through the use of Discover packets and Maintain packets that previously set SIM members will emit after a reboot. Once a MS has had its MAC address and password saved to the CS's database, if a reboot occurs in the MS, the CS will keep this MS information in its database and when a MS has been rediscovered, it will add the MS back into the SIM tree automatically. No configuration will be necessary to rediscover these switches. There are some instances where pre-saved MS switches cannot be rediscovered. For example, if the Switch is still powered down, if it has become the member of another group, or if it has been configured to be a Commander Switch, the rediscovery process cannot occur.

This version will support multiple switch upload and downloads for firmware, configuration files and log files, as follows:

- Firmware – The switch now supports multiple MS firmware downloads from a TFTP server.
- Configuration Files – This switch now supports multiple downloading and uploading of configuration files both to (for configuration restoration) and from (for configuration backup) MS's, using a TFTP server..
- Log – The switch now supports uploading multiple MS log files to a TFTP server.

The SIM commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
enable sim	
disable sim	
show sim	{[candidates {<candidate_id 1-100>} members {<member_id 1-32>} group {commander_mac <macaddr>} neighbor]}
reconfig	[member_id <value 1-32> exit]
config sim_group	[add <candidate_id 1-100> {<password>} delete <member_id 1-32>]
config sim	[[commander {group_name <groupname 64>} candidate] dp_interval <sec 30-90> hold_time <sec 100-255>]
download sim_ms	[firmware_from_tftp configuration_from_tftp] <ipaddr> <path_filename> {[members <mslist 1-32> all]}
upload sim_ms	[configuration_to_tftp log_to_tftp] <ipaddr> <path_filename> {[members <mslist> all]}

Each command is listed, in detail, in the following sections.

enable sim	
Purpose	Used to enable Single IP Management (SIM) on the Switch.
Syntax	enable sim
Description	This command will enable SIM globally on the Switch. SIM features and functions will not function properly unless this function is enabled.
Parameters	None.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To enable SIM on the Switch:

DGS-3400:4#enable sim

Command: enable sim

Success.

DGS-3400:4#

disable sim

Purpose Used to disable Single IP Management (SIM) on the Switch.

Syntax **disable sim**

Description This command will disable SIM globally on the Switch.

Parameters None.

Restrictions Only administrator-level users can issue this command.

Example usage:

To disable SIM on the Switch:

DGS-3400:4#disable sim

Command: disable sim

Success.

DGS-3400:4#

show sim

Purpose Used to view the current information regarding the SIM group on the Switch.

Syntax **show sim** {[**candidates** {<candidate_id 1-100>} | **members** {<member_id 1-32>} | **group** {**commander_mac** <macaddr>}} | **neighbor**}]

Description This command will display the current information regarding the SIM group on the Switch, including the following:

SIM Version - Displays the current Single IP Management version on the Switch.

Firmware Version - Displays the current Firmware version on the Switch.

Device Name - Displays the user-defined device name on the Switch.

MAC Address - Displays the MAC Address of the Switch.

Capabilities - Displays the type of switch, be it Layer 2 (L2) or Layer 3 (L3).

Platform - Switch Description including name and model number.

SIM State - Displays the current Single IP Management State of the Switch, whether it be enabled or disabled.

Role State - Displays the current role the Switch is taking, including Commander, Member or Candidate. A Stand-alone switch will always have the commander role.

Discovery Interval - Time in seconds the Switch will send discovery packets out over the network.

Hold time - Displays the time in seconds the Switch will hold discovery results before dropping it or utilizing it.

Parameters *candidates* <candidate_id 1-100> - Entering this parameter will display information concerning candidates of the SIM group. To view a specific candidate, include that candidate's ID number, listed from 1 to 100.

members <member_id 1-32> - Entering this parameter will display information concerning members of the SIM group. To view a specific member, include that member's ID number, listed from 1 to 32.

group {**commander_mac** <macaddr>} - Entering this parameter will display

show sim

information concerning the SIM group. To view a specific group, include the commander's MAC address of the group.

neighbor – Entering this parameter will display neighboring devices of the Switch. A SIM neighbor is defined as a switch that is physically connected to the Switch but is not part of the SIM group. This screen will produce the following results:

Port – Displays the physical port number of the commander switch where the uplink to the neighbor switch is located.

MAC Address – Displays the MAC Address of the neighbor switch.

Role – Displays the role(CS, CaS, MS) of the neighbor switch.

Restrictions Only administrator-level users can issue this command.

Example usage:

To show the SIM information in detail:

```
DGS-3400:4#show sim
Command: show sim

SIM Version      : VER-1.61
Firmware Version : 2.00.B46
Device Name      :
MAC Address      : 00-10-20-33-45-00
Capabilities      : L2
Platform         : DGS-3400 L2 Switch
SIM State        : Disabled
Role State       : Candidate
Discovery Interval : 30 sec
Holdtime         : 100 sec

DGS-3400:4#
```

To show the candidate information in summary, if the candidate ID is specified:

```
DGS-3400:4#show sim candidates 1-2
Command: show sim candidates 1-2
```

ID	MAC Address	Platform / Capability	Hold Time	Firmware Version	Device Name
1	00-01-02-03-04-00	DGS-3400 L2 Switch	40	2.00.B46	The Man
2	00-55-55-00-55-00	DGS-3400 L2 Switch	140	2.00.B46	default master

```
Total Entries: 2

DGS-3400:4#
```

To show the member information in summary, if the member ID is specified:

```
DGS-3400:4#show sim member 1-2
Command: show sim member 1-2
```

ID	MAC Address	Platform / Capability	Hold Time	Firmware Version	Device Name
1	00-01-02-03-04-00	DGS-3400 L2 Switch	40	2.00.B46	The Man
2	00-55-55-00-55-00	DGS-3400 L2 Switch	140	2.00.B46	default master

```
Total Entries: 2

DGS-3400:4#
```

To show other groups information in summary, if group is specified:

```
DGS-3400:4#show sim group
Command: show sim group

SIM Group Name : default

ID  MAC Address          Platform /          Hold   Firmware   Device Name
---  -
*1  00-01-02-03-04-00    DGS-3400 L2 Switch  40     2.00.B46   Trinity
2   00-55-55-00-55-00    DGS-3400 L2 Switch  140    2.00.B46   default master

SIM Group Name : SIM2

ID  MAC Address          Platform /          Hold   Firmware   Device Name
---  -
*1  00-01-02-03-04-00    DGS-3400 L2 Switch  40     2.00.B46   Neo
2   00-55-55-00-55-00    DGS-3400 L2 Switch  140    2.00.B46   default master

'*' means commander switch.

DGS-3400:4#
```

Example usage:

To view SIM neighbors:

```
DGS-3400:4#show sim neighbor
Command: show sim neighbor

Neighbor Info Table

Port  MAC Address          Role
-----
23    00-35-26-00-11-99    Commander
23    00-35-26-00-11-91    Member
24    00-35-26-00-11-90    Candidate

Total Entries: 3

DGS-3400:4#
```

reconfig

Purpose	Used to connect to a member switch, through the commander switch, using Telnet.
Syntax	reconfig {member_id <value 1-32 exit>}
Description	This command is used to reconnect to a member switch using Telnet.
Parameters	<i>member_id</i> <value 1-32> - Select the ID number of the member switch to configure. <i>exit</i> – This command is used to exit from managing the member switch and will return to managing the commander switch.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To connect to the MS, with member ID 2, through the CS, using the command line interface:

DGS-3400:4#reconfig member_id 2

Command: reconfig member_id 2

DGS-3400:4#

Login:

config sim_group

Purpose	Used to add candidates and delete members from the SIM group.
Syntax	config sim_group [add <candidate_id 1-100> {<password>} delete <member_id 1-32>]
Description	This command is used to add candidates and delete members from the SIM group by ID number.
Parameters	<i>add <candidate_id 1-100> <password></i> - Use this parameter to change a Candidate Switch (CaS) to a Member Switch (MS) of a SIM group. The CaS may be defined by its ID number and a password (if necessary). <i>delete <member_id 1-32></i> - Use this parameter to delete a member switch of a SIM group. The member switch should be defined by ID number.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To add a member:

DGS-3400:4#config sim_group add 2

Command: config sim_group add 2

Please wait for ACK!!!

SIM Config Success !!!

Success.

DGS-3400:4#

To delete a member:

DGS-3400:4#config sim_group delete 1

Command: config sim_group delete 1

Please wait for ACK!!!

SIM Config Success!!!

Success.

DGS-3400:4#

config sim

Purpose	Used to configure role parameters for the SIM protocol on the Switch.
Syntax	config sim [[commander {group_name <groupname 64> candidate} dp_interval <sec 30-90> hold_time <sec 100-255>]
Description	This command is used to configure parameters of switches of the SIM.
Parameters	<i>commander</i> – Use this parameter to configure the commander switch(CS) for the following parameters: <i>group_name <groupname 64></i> - Used to update the name of the group. Enter an alphanumeric string of up to 64 characters to rename the SIM group. <i>dp_interval <30-90></i> – The user may set the discovery protocol interval, in seconds that the Switch will send out discovery packets. Returning information to the CS will include information about other switches connected to it. (Ex. MS, CaS). The user may set the <i>dp_interval</i> from 30 to 90 seconds. <i>hold time <sec 100-255></i> – Using this parameter, the user may set the time, in seconds, the CS will hold information sent to it from other switches, utilizing the discovery interval protocol. The user may set the hold time from 100 to 255 seconds. <i>candidate</i> – Used to change the role of a CS (commander) to a CaS (candidate). <i>dp_interval <30-90></i> – The user may set the discovery protocol interval, in seconds that the Switch will send out discovery packets. Returning information to the CS will include information about other switches connected to it. (Ex. MS, CaS). The user may set the <i>dp_interval</i> from 30 to 90 seconds. <i>hold time <100-255></i> – Using this parameter, the user may set the time, in seconds, the Switch will hold information sent to it from other switches, utilizing the discovery interval protocol. The user may set the hold time from 100 to 255 seconds.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To change the time interval of the discovery protocol:

```
DGS-3400:4# config sim commander
Command: config sim commander

Success.

DGS-3400:4#
```

To change the hold time of the discovery protocol:

```
DGS-3400:4# config sim hold_time 120
Command: config sim hold_time 120

Success.

DGS-3400:4#
```

To transfer the CS (commander) to be a CaS (candidate):

```
DGS-3400:4# config sim candidate
Command: config sim candidate

Success.

DGS-3400:4#
```

To transfer the Switch to be a CS:

```
DGS-3400:4# config sim commander
Command: config sim commander

Success.

DGS-3400:4#
```

To update the name of a group:

```
DGS-3400:4# config sim commander group_name Trinity
Command: config sim commander group_name Trinity

Success.

DGS-3400:4#
```

download sim_ms

Purpose	Used to download firmware or configuration file to an indicated device.
Syntax	download sim [firmware_from_tftp configuration_from_tftp] <ipaddr> <path_filename> {[members <mslist 1-32> all]}
Description	This command will download a firmware file or configuration file to a specified device from a TFTP server.
Parameters	<i>firmware_from_tftp</i> – Specify this parameter to download firmware to members of a SIM group. <i>configuration_from_tftp</i> - Specify this parameter to download a switch configuration to members of a SIM group. <i><ipaddr></i> – Enter the IP address of the TFTP server. <i><path_filename></i> – Enter the path and the filename of the firmware or switch on the TFTP server. <i>members</i> – Enter this parameter to specify the members to which to download firmware or switch configuration files. The user may specify a member or members by adding one of the following: ▪ <i><mslist 1-32></i> - Enter a value, or values to specify which members of the SIM group will receive the firmware or switch configuration. ▪ <i>all</i> – Add this parameter to specify all members of the SIM group will receive the firmware or switch configuration.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To download firmware:

```
DGS-3400:4# download sim_ms firmware_from_tftp 10.53.13.94 c:/dgs3426.had all
Command: download sim_ms firmware_from_tftp 10.53.13.94 c:/dgs3426.had all
```

This device is updating firmware. Please wait...

Download Status :

ID	MAC Address	Result
1	00-01-02-03-04-00	Success
2	00-07-06-05-04-03	Success
3	00-07-06-05-04-03	Success

DGS-3400:4#

To download configuration files:

```
DGS-3400:4# download sim configuration_from_tftp 10.53.13.94 c:/ dgs3426.txt all
Command: download sim configuration_from_tftp 10.53.13.94 c:/ dgs3426.txt all
```

This device is updating configuration. Please wait...

Download Status :

ID	MAC Address	Result
1	00-01-02-03-04-00	Success
2	00-07-06-05-04-03	Success
3	00-07-06-05-04-03	Success

DGS-3400:4#

upload sim_ms

Purpose	User to upload a configuration file to a TFTP server from a specified member of a SIM group.
Syntax	upload sim_ms [configuration_to_tftp log_to_tftp] <ipaddr> <path_filename> {[members <mslist> all]}
Description	This command will upload a configuration file to a TFTP server from a specified member of a SIM group.
Parameters	<i>configuration_to_tftp</i> - Specify this parameter if the user wishes to upload a switch configuration to members of a SIM group. <i>log_to_tftp</i> - Specify this parameter if the user wishes to upload a switch log to members of a SIM group. <i><ipaddr></i> - Enter the IP address of the TFTP server to which to upload a configuration file. <i><path_filename></i> - Enter a user-defined path and file name on the TFTP server to which to upload configuration files. <i>members</i> - Enter this parameter to specify the members to which to upload switch configuration or log files. The user may specify a member or members by adding one of the following: <i><mslist></i> - Enter a value, or values to specify which members of the SIM group will upload the switch configuration or log files. <i>all</i> - Add this parameter to specify all members of the SIM group will upload the switch configuration or log files.
Restrictions	Only administrator-level users can issue this command.

Example usage:

To upload configuration files to a TFTP server:

DGS-3400:4# upload sim_ms configuration 10.55.47.1 D:\configuration.txt 1

Command: upload sim_ms configuration 10.55.47.1 D:\configuration.txt 1

This device is upload configuration. Please wait several minutes...

Success.

DGS-3400:4#

PoE COMMANDS

The xStack DGS-3426P supports Power over Ethernet (PoE) as defined by the IEEE 802.3af specification. Ports 1-24 supply 48 VDC power to PDs over Category 5 or Category 3 UTP Ethernet cables. The xStack DGS-3426P follows the standard PSE pinout *Alternative A*, whereby power is sent out over pins 1, 2, 3 and 6. The xStack DGS-3426P works with all D-Link 802.3af capable devices.

The xStack DGS-3426P includes the following PoE features:

- The auto-discovery feature recognizes the connection of a PD (Powered Device) and automatically sends power to it.
- The auto-disable feature will occur under two conditions: first, if the total power consumption exceeds the system power limit; and second, if the per port power consumption exceeds the per port power limit.
- The active circuit protection feature automatically disables the port if there is a short. Other ports will remain active.

PDs receive power according to the following classification:

Class	Max power used by PD
0	0.44 to 12.95W
1	0.44 to 3.84W
2	3.84 to 6.49W
3	6.49 to 12.95W

PSE provides power according to the following classification:

Class	Max power provided by PSE
0	15.4W
1	4.0W
2	7.0W
3	15.4W

The PoE commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
config poe system	{units [<unitlist> all]} {power_limit <value 37-370> power_disconnect_method [deny_next_port deny_low_priority_port] management_mode [power_limit auto]}
config poe ports	[all <portlist>] {state [enable disable] priority [critical high low] power_limit [class_0 class_1 class_2 class_3 user_define <value 1000-16800>]}
show poe ports	{<portlist>}
show poe system	units <unitlist>

Each command is listed in detail in the following sections.

config poe system

Purpose	Used to configure the parameters for the whole PoE system.
Syntax	config poe system {units [<unitlist> all]} {power_limit <value 37-370> power_disconnect_method [deny_next_port deny_low_priority_port] management_mode [power_limit auto]}
Description	Allows the user to configure the parameters for the whole PoE system.
Parameters	<i>units</i> <unitlist>-- Enter the switch in the switch stack for which to configure the PoE system. This number is based on the unit ID assigned to the switch in the switch stack. The DGS-3426P is the only switch in this series with PoE capabilities.

config poe system

power_limit - The power limit parameter allows the user to configure the power budget of whole PoE system. The minimum setting is 37 W and the maximum is 370W (depending on the power supplier's capability). Default setting is 370 W.

power_disconnect_method - This parameter is used to configure the power management disconnection method. When the total consumed power exceeds the power budget, the PoE controller initiates a port disconnection to prevent overloading the power supply. The controller uses one of the following two ways to implement the disconnection:

- **deny_next_port** - After the power budget has been exceeded, the next port attempting to power up is denied, regardless of its priority.
- **deny_low_priority_port** - After the power budget has been exceeded, the next port attempting to power up, causes the port with the lowest priority to shut down (to allow high-priority ports to power up).

The default setting is **deny_next_port**.

management_mode – Use this parameter to utilize the PoE management mode function of this switch. The user has two choices:

- **power_limit** - Choose this option to shut down the port if the power limit on the port exceeds the limit stated by the user configured in the **power_limit** field.
- **auto** - Choose this field to automatically disconnect the power from a given port when it exceeds the maximum power used, as defined by the PD's (power device) power class, stated previously in this section. When a PD is attached to a port on the Switch, the Power Class is automatically determined. If the PD's power class is unspecified or there is an error in determining the power class, it is given the power class zero (0).

Restrictions

User Account Command Level – Administrator and Operator

Example usage:

To config the PoE System on the Switch:

```
DGS-3400:4#config poe system units 1 power_limit 300 power_disconnect_method deny_next_port management_mode auto
```

```
Command: config poe system units 1 power_limit 300 power_disconnect_method deny_next_port management_mode auto
```

Success.

```
DGS-3400:4#
```

config poe ports

Purpose	Used to configure the PoE port settings.
Syntax	config poe ports [all <portlist>] {state [enable disable] priority [critical high low] power_limit [class_0 class_1 class_2 class_3 user_define <value 1000-16800>]}
Description	The config poe ports command is used to configure the PoE port settings.
Parameters	<portlist> -Specifies a range of ports to be configured or all the ports. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch

config poe ports

number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)

all – Specifies that all ports on the Switch will be configured for PoE.

state - Enables or disables the PoE function on the Switch.

priority - Setting the port priority affects power-up order and shutdown order. **Power-up order:** When the Switch powers-up or reboots, the ports are powered up according to their priority (*critical* first, then *high* and finally *low*). **Shutdown order:** When the power limit has been exceeded, the ports will shut down according to their priority if the power disconnect method is set to *deny_low_priority_port*.

- *critical* – Specifying this parameter will nominate these ports as having the highest priority for all configured PoE ports. These ports will be the first ports to receive power and the last to disconnect power.
- *high* – Specifying this parameter will nominate these ports as having the second highest priority for receiving power and shutting down power.
- *low* – Specifying this parameter will nominate these ports as having the lowest priority for receiving and shutting down power. These ports will be the first ports to have their power disconnected if the *power_disconnect_method* chosen in the **config poe system** command is *deny_low_priority_port*.

power_limit – Allows the user to configure the per-port power limit. If a port exceeds its power limit, the PoE system will shut down that port. The minimum user-defined setting is 1000mW and maximum is 16800mW. The default setting is 15400mW. The user may also choose to define a power class by which to set the power limit, based on the PSE table at the beginning of this section.

- *class_0* – Choosing this class will set the maximum port limit at 15.4W.
- *class_1* - Choosing this class will set the maximum port limit at 4.0W.
- *class_2* - Choosing this class will set the maximum port limit at 7.0W.
- *class_3* - Choosing this class will set the maximum port limit at 15.4.0W.
- *user_define* – Choosing this parameter will allow the user to set a power limit between 1000 and 16800mW with a default value of 15400mW.

Restrictions

Only administrator-level users can issue this command.

Example usage:

To config the Switch's ports for PoE:

DGS-3400:4#config poe ports 1:1-1:3 state enable priority critical power_limit class_0

Command: config poe ports 1:1-1:3 state enable priority critical power_limit class_0

Power limit has been set to 15400mW(Class 0 PD upper power limit 12.95W + power loss on cable).

Success.

DGS-3400:4#

show poe ports

Purpose	Used to display the setting and actual values of the whole PoE system.
Syntax	show poe ports {<portlist>}
Description	Display the settings, actual values and port configuration of the whole PoE system.
Parameters	<i>ports</i> – Choosing this parameter will display the settings for PoE on a port-by-port basis. <i>portlist</i> – Enter a port or range of ports to be displayed for their PoE settings. The port list is specified by listing the lowest switch number and the beginning port number on that switch, separated by a colon. Then the highest switch number, and the highest port number of the range (also separated by a colon) are specified. The beginning and end of the port list range are separated by a dash. For example, 1:3 specifies switch number 1, port 3. 2:4 specifies switch number 2, port 4. 1:3-2:4 specifies all of the ports between switch 1, port 3 and switch 2, port 4 – in numerical order. Non-contiguous portlist entries are separated by a comma. (ex: 1:1-1:3,1:7-1:9)
Restrictions	None.

Example usage:

To display the power settings for the switch's ports

DGS-3400:4#show poe ports

Command: show poe ports

Port	State Class Status	Priority Power(mW)	Power Limit(mW) Voltage(decivolt)	Current (mA)
=====				
1:1	Enabled 0	Critical 0	12000(User-defined) 0	0
	OFF : Non-standard PD connected			
1:2	Enabled 0	Critical 0	12000(User-defined) 0	0
	OFF : Interim state during line detection			
1:3	Enabled 0	Critical 0	12000(User-defined) 0	0
	OFF : Interim state during line detection			
1:4	Enabled 0	Low 0	15400(User-defined) 0	0
	OFF : Interim state during line detection			
1:5	Enabled 0	Low 0	15400(User-defined) 0	0
	OFF : Interim state during line detection			
1:6	Enabled 0	Low 0	15400(User-defined) 0	0
	OFF : Interim state during line detection			

CTRL+C ESC q Quit SPACE n Next Page ENTER Next Entry a All

show poe system

Purpose	Used to display the setting and actual values of the whole PoE system.
Syntax	show poe system {units <unitlist>}
Description	This command will display the system settings for PoE, such as

show poe system

	switch power limit, consumption, remaining useable power and the power disconnection method.
Parameters	<i>units <unitlist></i> - Select the switch in the switch stack for which to show the PoE system settings. This unit number is based on the unit ID assigned to switches in the switch stack. The DGS-3426P is currently the only switch in this series with PoE capabilities.
Restrictions	None.

Example usage:

To display the power settings for the switch system:

DGS-3400:4#show poe system

Command: show poe system

Unit 1 PoE System Information

```

-----
Power Limit           : 300 (watts)
Power Consumption     : 0 (watts)
Power Remained        : 300 (watts)
Power Disconnection Method : deny next port

```

If Power Disconnection Method is set to deny next port, then the system cannot utilize its maximum power capacity. The maximum unused watt is 19W.

DGS-3400:4#

COMMAND HISTORY LIST

The switch history commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

Command	Parameters
?	
config command_history	<value 1-40>
show command_history	

Each command is listed, in detail, in the following sections.

?	
Purpose	Used to display all commands in the Command Line Interface (CLI).
Syntax	? {<command>}
Description	This command will display all of the commands available through the Command Line Interface (CLI).
Parameters	{<command>} – Entering the question mark with an appropriate command will list all the corresponding parameters for the specified command, along with a brief description of the commands function and similar commands having the same words in the command.
Restrictions	None.

Example usage:

To display all of the commands in the CLI:

```
DGS-3400:4#?
..
?
clear
clear arptable
clear attack_log
clear counters
clear fdb
clear log
clear port_security_entry port
config 802.1p default_priority
config 802.1p user_priority
config 802.1x auth_mode
config 802.1x auth_parameter ports
config 802.1x auth_protocol
config 802.1x capability ports
config 802.1x init
config 802.1x reauth
config access_profile profile_id
config account
config address_binding ip_mac ipaddress
config address_binding ip_mac ports
config admin local_enable
config arpentry
CTRL+C ESC q Quit SPACE n Next Page ENTER Next Entry a All
```

To display the parameters for a specific command:

```
DGS-3400:4# config stp
Command:? config stp

Command: config stp
Usage: {maxage <value 6-40> | maxhops <value1-20> | hellotime <value 1-10> | forwarddelay <value 4-30> | txholdcount <value 1-10> | fbpdu [enable | disable] | lbd [enable | disable] | lbd_recover_timer [0 | <value 60-1000000>]}
Description: Used to update the STP Global Configuration.
config stp instance_id
config stp mst_config_id
config stp mst_ports
config stp ports
config stp priority
config stp version

DGS-3400:4#
```

config command_history

Purpose	Used to configure the command history.
Syntax	config command_history <value 1-40>
Description	This command is used to configure the command history.
Parameters	<value 1-40> – The number of previously executed commands maintained in the buffer. Up to 40 of the latest executed commands may be viewed.
Restrictions	Only administrator-level users can issue this command.

Example usage

To configure the command history:

```
DGS-3400:4#config command_history 20
Command: config command_history 20

Success.

DGS-3400:4#
```

show command_history

Purpose	Used to display the command history.
Syntax	show command_history
Description	This command will display the command history.
Parameters	None.
Restrictions	None.

Example usage

To display the command history:

DGS-3400:4#show command_history

Command: show command_history

?

? show

show vlan

show command history

DGS-3400:4#

MODIFY BANNER AND PROMPT COMMANDS

Administrator level users can modify the login banner (greeting message) and command prompt by using the commands described below.

Command	Parameters
config greeting_message	{default}
config command_prompt	[<string 16> username default]
show greeting_message	

The Modify Banner and Prompt commands in the Command Line Interface (CLI) are listed (along with the appropriate parameters) in the following table.

config greeting_message	
Purpose	Used to configure the login banner (greeting message).
Syntax	config greeting_message {default}
Description	Users can use this command to modify the login banner (greeting message).
Parameters	<i>default</i> – If the user enters <i>default</i> to the modify banner command, then the banner will be reset to the original factory banner. To open the Banner Editor, click <i>enter</i> after typing the <i>config greeting_message</i> command. Type the information to be displayed on the banner by using the commands described on the Banner Editor: Quit without save: Ctrl+C Save and quit: Ctrl+W Move cursor: Left/Right/Up/Down Delete line: Ctrl+D Erase all setting: Ctrl+X Reload original setting: Ctrl+L
Restrictions	Only administrator-level users can issue this command. Other restrictions include: • If the “reset/reset config” command is executed, the modified banner will remain modified. However, the “reset system” command will reset the modified banner to the original factory banner. • The capacity of the banner is 6*80. 6 Lines and 80 characters per line. • Ctrl+W will only save the modified banner in the DRAM. You need to type “save” command to save it into FLASH. • Only valid in threshold level.

Example usage:

To modify the banner to read “Good evening Mr. Bond.”:

```
DGS-3400:4# config greeting_message
Command: config greeting_message

Greeting Messages Editor

                                Ctrl+D       Delete line
                                Ctrl+X       Erase all setting
                                Ctrl+L       Reload original setting
=====
```

show greeting_message

Purpose	Used to view the currently configured greeting message configured on the Switch.
Syntax	show greeting_message
Description	This command is used to view the currently configured greeting message on the Switch.
Parameters	None.
Restrictions	None.

Example usage:

To view the currently configured greeting message:

```
DGS-3400:4#show greeting_message
Command: show greeting_message

=====
                        DGS-3400 Gigabit Ethernet Switch

DGS-3400:4#
```

config command prompt

Purpose	Used to Configure the command prompt.
Syntax	config command_prompt [<string 16> username default]
Description	Administrator level users can use this command to change the command prompt.
Parameters	<i>string 16</i> - The command prompt can be changed by entering a new name of no more than 16 characters. <i>username</i> - The command prompt will be changed to the login username. <i>default</i> – The command prompt will reset to factory default

config command prompt

	command prompt.
Restrictions	Only administrator-level users can issue this command. Other restrictions include: • If the “reset” command is executed, the modified command prompt will remain modified. However, the “reset system/config” command will reset the command prompt to the original factory banner.

Example usage

To modify the command prompt to “AtYourService”:

```
DGS-3400:4#config command_prompt AtYourService
Command: config command_prompt AtYourService

Success.

AtYourService:4#
```

TECHNICAL SPECIFICATIONS
